## FITS FOR $K_L^0$ CP-VIOLATION PARAMETERS

Revised April 2000 by T.G. Trippe (LBNL).

In recent years,  $K_L^0$  *CP*-violation experiments have improved our knowledge of *CP*-violation parameters and their consistency with the expectations of *CPT* invariance and unitarity. For definitions of  $K_L^0$  *CP*-violation parameters and a brief discussion of the theory, see the article "*CP* Violation" by L. Wolfenstein in Section 12 of this *Review*.

This note describes our two fits for the *CP*-violation parameters in  $K_L^0 \to \pi^+\pi^-$  and  $\pi^0\pi^0$  decay, one for the phases  $\phi_{+-}$  and  $\phi_{00}$ , and another for the amplitudes  $|\eta_{+-}|$  and  $|\eta_{00}|$ .

Fit to  $\phi_{+-}, \phi_{00}, \Delta \phi, \Delta m,$  and  $\tau_s$  data: We perform a joint fit to the data on  $\phi_{+-}$ ,  $\phi_{00}$ , the phase difference  $\Delta \phi = \phi_{00} - \phi_{+-}$ , the  $K_L^0 - K_S^0$  mass difference  $\Delta m$ , and the  $K_S^0$ mean life  $\tau_s$ , including the effects of correlations. Measurements of  $\phi_{+-}$  and  $\phi_{00}$  are highly correlated with  $\Delta m$  and  $\tau_s$ . Some measurements of  $\tau_s$  are correlated with  $\Delta m$ . The correlations are given in the footnotes of the  $\phi_{+-}$  and  $\phi_{00}$  sections of the  $K^0_L$  Particle Listings and the  $\tau_{\scriptscriptstyle S}$  section of the  $K^0_S$  Particle listings. In editions of the Review prior to 1996, we adjusted the experimental values of  $\phi_{+-}$  and  $\phi_{00}$  to account for correlations with  $\Delta m$  and  $\tau_{\scriptscriptstyle S}$  but did not include the effects of these correlations when evaluating  $\Delta m$  and  $\tau_s$ . In 1996, we introduced a joint fit including these correlations. In this fit, the  $\phi_{+-}$  measurements have a strong influence on the fitted value of  $\Delta m$ . This is because the CERN NA31 vacuum regeneration experiments (CAROSI 90 [1] and GEWENIGER 74B [2]), the Fermilab E773/E731 regenerator experiments (SCHWIN-GENHEUER 95 [3] and GIBBONS 93 [4]), and the CPLEAR  $K^0 - \overline{K}^0$  asymmetry experiment (APOSTOLAKIS 99C [5]) have very different dependences of  $\phi_{+-}$  on  $\Delta m$ , as can be seen from their diagonal bands in Fig. 1.

The region where the  $\phi_{+-}$  bands from these experiments cross gives a powerful measurement of  $\Delta m$  which decreases the fitted  $\Delta m$  value relative to our pre-1996 average  $\Delta m$  and earlier measurements such as CULLEN 70 [6], GEWENIGER 74C [7], and GJESDAL 74 [8]. This decrease brings the  $\Delta m$ -dependent  $\phi_{+-}$  measurements into good agreement with each other and with  $\phi$ (superweak), where

$$\phi(\text{superweak}) = \tan^{-1} \left(\frac{2\Delta m}{\Delta\Gamma}\right) = \tan^{-1} \left(\frac{2\Delta m\tau_S\tau_L}{\hbar(\tau_L - \tau_S)}\right) \ . \tag{1}$$

The  $(\phi_{+-}, \tau_S)$  correlations influence the  $\tau_S$  fit result in a similar manner, as can be seen in Fig. 2. The influence of the  $\phi_{+-}$  experiments is not as great on  $\tau_S$  as it is on  $\Delta m$  because the indirect measurements of  $\tau_S$  derived from the diagonal crossing bands in Fig. 2 are not as precise as the direct measurements of  $\tau_S$  from E773 (SCHWINGENHEUER 95 [3]), E731 (GIBBONS 93 [4]), and NA31 (BERTANZA 97 [9]).

In Fig. 1 [Fig. 2] the slope of the diagonal  $\phi_{+-}$  bands shows the  $\Delta m \ [\tau_S]$  dependence; the unseen  $\tau_S \ [\Delta m]$  dependent term is evaluated using the fitted  $\tau_S \ [\Delta m]$ . The vertical half-width  $\sigma_{\phi}$  of each band is the  $\phi_{+-}$  error for fixed  $\Delta m \ [\tau_S]$  and includes the systematic error due to the error in the fitted  $\tau_S \ [\Delta m]$ .

Figure 1:  $\phi_{+-}$  vs  $\Delta m$ .  $\Delta m$  measurements appear as vertical bands spanning  $\Delta m \pm 1\sigma$ , some of which are cut near the top to aid the eye. The  $\phi_{+-}$  measurements appear as diagonal bands spanning  $\phi_{+-} \pm \sigma_{\phi}$ . The dashed line shows  $\phi$ (superweak). The ellipse shows the  $1\sigma$  contour of the fit result. See Table 1 for data references.

Table 2 gives the resulting fit values for the parameters and Table 3 gives the correlation matrix. The resulting  $\phi_{+-}$  is in good agreement with  $\phi(\text{superweak}) = 43.49 \pm 0.07^{\circ}$  obtained from Eq. (1) using  $\Delta m$  and  $\tau_s$  from Table 2.

The  $\chi^2$  is 16.0 for 20 degrees of freedom, indicating good agreement of the input data. Nevertheless, there has been criticism that Fermilab E773 (SCHWINGENHEUER 95 [3]) and E731 (GIBBONS 93 [4]) measure  $\phi_{+-} - \phi_f$  and calculate the regeneration phase  $\phi_f$  from the power law momentum dependence of the regeneration amplitude using analyticity and dispersion relations. In the E731 result, a systematic error of  $\pm 0.5$  degrees for departures from a pure power-law is included. For the E773 result, they modeled a variety of effects that do distort the amplitude from a pure power law and ascribed a  $\pm 0.35^{\circ}$  systematic error from uncertainties in these effects. Even so, the E731 result remains valid within its quoted errors. KLEINKNECHT 94 [16] and KLEINKNECHT 95 [17] argue that these systematic errors should be around 3°, primarily because of the absence of data on the momentum dependence of the regeneration amplitude above 160 GeV/c. BRIERE 95 [18] and BRIERE 95C [19] reply that the current understanding

Figure 2:  $\phi_{+-}$  vs  $\tau_s$ .  $\tau_s$  measurements appear as vertical bands spanning  $\tau_s \pm 1\sigma$ , some of which are cut near the top to aid the eye. The  $\phi_{+-}$  measurements appear as diagonal bands spanning  $\phi_{+-} \pm \sigma_{\phi}$ . The dashed line shows  $\phi$ (superweak). The ellipse shows the fit result's  $1\sigma$  contour. See Table 1 for data references.

of regeneration is sufficient to allow a precise and reliable correction for the region above 160 GeV/c. The question is one of judgement about the reliability of the assumptions used. In the absence of any contradictory evidence, we choose to accept the judgement of the E731/E773 experimenters in setting their systematic errors.

## Fit for $\epsilon'/\epsilon, \, |\eta_{+-}|, \, |\eta_{00}|, \, { m and} \, { m B}(K_L o \pi\pi)$

We list measurements of  $|\eta_{+-}|$ ,  $|\eta_{00}|$ ,  $|\eta_{00}/\eta_{+-}|$  and  $\epsilon'/\epsilon$ . Independent information on  $|\eta_{+-}|$  and  $|\eta_{00}|$  can be obtained from measurements of the  $K_L^0$  and  $K_S^0$  lifetimes  $(\tau_L, \tau_S)$  and branching ratios (B) to  $\pi\pi$ , using the relations

$$|\eta_{+-}| = \left[\frac{\mathcal{B}(K_L^0 \to \pi^+ \pi^-)}{\tau_L} \frac{\tau_S}{\mathcal{B}(K_S^0 \to \pi^+ \pi^-)}\right]^{1/2} , \quad (2a)$$

$$|\eta_{00}| = \left[\frac{{\rm B}(K^0_L\to\pi^0\pi^0)}{\tau_{_L}}\;\frac{\tau_{_S}}{{\rm B}(K^0_S\to\pi^0\pi^0)}\right]^{1/2}\;. \eqno(2b)$$

For historical reasons the branching ratio fits and the *CP*violation fits are done separately, but we want to include the influence of  $|\eta_{+-}|$ ,  $|\eta_{00}|$ ,  $|\eta_{00}/\eta_{+-}|$ , and  $\epsilon'/\epsilon$  measurements on  $B(K_L^0 \to \pi^+\pi^-)$  and  $B(K_L^0 \to \pi^0\pi^0)$  and vice versa. We approximate a global fit to all of these measurements by first

performing two independent fits: 1) BRFIT, a fit to the  $K_L^0$  branching ratios, rates, and mean life, and 2) ETAFIT, a fit to

the  $|\eta_{+-}|$ ,  $|\eta_{00}|$ ,  $|\eta_{+-}/\eta_{00}|$ , and  $\epsilon'/\epsilon$  measurements. The results from fit 1, along with the  $K_S^0$  values from this edition are used to compute values of  $|\eta_{+-}|$  and  $|\eta_{00}|$  which are included as measurements in the  $|\eta_{00}|$  and  $|\eta_{+-}|$  sections with a document ID of BRFIT 00. Thus the fit values of  $|\eta_{+-}|$  and  $|\eta_{00}|$  given in this edition include both the direct measurements and the results from the branching ratio fit.

The process is reversed in order to include the direct  $|\eta|$  measurements in the branching ratio fit. The results from fit 2 above (before including BRFIT 00 values) are used along with the  $K_L^0$  and  $K_S^0$  mean lives and the  $K_S^0 \to \pi\pi$  branching fractions to compute the  $K_L^0$  branching ratios  $\Gamma(K_L^0 \to \pi^+\pi^-)/\Gamma(\text{total})$  and  $\Gamma(K_L^0 \to \pi^0\pi^0)/\Gamma(K_L^0 \to \pi^+\pi^-)$ . These branching ratio values are included as measurements in the branching ratio section with a document ID of ETAFIT 00. Thus the  $K_L^0$  branching ratio fit values in this edition include the results of direct measurements of  $|\eta_{+-}|$ ,  $|\eta_{00}|$ ,  $|\eta_{00}/\eta_{+-}|$ , and  $\epsilon'/\epsilon$ . A more detailed discussion of these fits is given in the 1990 edition of this *Review* [20].
