Quark and Lepton Compositeness, Searches for

SEARCHES FOR QUARK AND LEPTON COMPOSITENESS

Revised 2001 by K. Hagiwara (KEK), and K. Hikasa and M. Tanabashi (Tohoku University).

If quarks and leptons are made of constituents, then at the scale of constituent binding energies, there should appear new interactions among quarks and leptons. At energies much below the compositeness scale (Λ), these interactions are suppressed by inverse powers of Λ . The dominant effect should come from the lowest dimensional interactions with four fermions (contact terms), whose most general chirally invariant form reads [1]

$$L = \frac{g^2}{2\Lambda^2} \left[\eta_{LL} \,\overline{\psi}_L \,\gamma_\mu \,\psi_L \,\overline{\psi}_L \,\gamma^\mu \,\psi_L + \eta_{RR} \,\overline{\psi}_R \,\gamma_\mu \,\psi_R \,\overline{\psi}_R \,\gamma^\mu \,\psi_R \right. \\ \left. + 2\eta_{LR} \,\overline{\psi}_L \,\gamma_\mu \,\psi_L \,\overline{\psi}_R \,\gamma^\mu \,\psi_R \right] \,. \tag{1}$$

Chiral invariance provides a natural explanation why quark and lepton masses are much smaller than their inverse size Λ . We may determine the scale Λ unambiguously by using the above form of the effective interactions; the conventional method [1] is to fix its scale by setting $g^2/4\pi = g^2(\Lambda)/4\pi = 1$ for the new strong interaction coupling and by setting the largest magnitude of the coefficients $\eta_{\alpha\beta}$ to be unity. In the following, we denote

$$\begin{split} \Lambda &= \Lambda_{LL}^{\pm} \quad \text{for} \quad (\eta_{LL}, \, \eta_{RR}, \, \eta_{LR}) = (\pm 1, \, 0, \, 0) \, , \\ \Lambda &= \Lambda_{RR}^{\pm} \quad \text{for} \quad (\eta_{LL}, \, \eta_{RR}, \, \eta_{LR}) = (0, \, \pm 1, \, 0) \, , \\ \Lambda &= \Lambda_{VV}^{\pm} \quad \text{for} \quad (\eta_{LL}, \, \eta_{RR}, \, \eta_{LR}) = (\pm 1, \, \pm 1, \, \pm 1) \, , \\ \Lambda &= \Lambda_{AA}^{\pm} \quad \text{for} \quad (\eta_{LL}, \, \eta_{RR}, \, \eta_{LR}) = (\pm 1, \, \pm 1, \, \pm 1) \, , \end{split}$$
(2)
HTTP://PDG.LBL.GOV Page 1 Created: 6/2/2004 14:08

as typical examples. Such interactions can arise by constituent interchange (when the fermions have common constituents, *e.g.*, for $ee \rightarrow ee$) and/or by exchange of the binding quanta (whenever binding quanta couple to constituents of both particles).

Another typical consequence of compositeness is the appearance of excited leptons and quarks (ℓ^* and q^*). Phenomenologically, an excited lepton is defined to be a heavy lepton which shares leptonic quantum number with one of the existing leptons (an excited quark is defined similarly). For example, an excited electron e^* is characterized by a nonzero transitionmagnetic coupling with electrons. Smallness of the lepton mass and the success of QED prediction for g-2 suggest chirality conservation, *i.e.*, an excited lepton should not couple to both left- and right-handed components of the corresponding lepton.

Excited leptons may be classified by $SU(2) \times U(1)$ quantum numbers. Typical examples are:

1. Sequential type

$$\left(egin{array}{c}
u^* \ \ell^* \end{array}
ight)_L \,, \qquad \left[
u^*_R
ight] \,, \qquad \ell^*_R \,.$$

 ν_R^* is necessary unless ν^* has a Majorana mass.

2. Mirror type

$$[
u_L^*], \quad \ell_L^*, \quad \left(egin{array}{c}
u^* \\
\ell^* \end{array}
ight)_R.$$

3. Homodoublet type

$$\begin{pmatrix} \nu^* \\ \ell^* \end{pmatrix}_L, \qquad \begin{pmatrix} \nu^* \\ \ell^* \end{pmatrix}_R$$

Similar classification can be made for excited quarks.

Excited fermions can be pair produced via their gauge couplings. The couplings of excited leptons with Z are listed

HTTP://PDG.LBL.GOV

Created: 6/2/2004 14:08

	1 01	01	Homodoublet type
$V^{\ell^{*}} A^{\ell^{*}} V^{ u_{D}} A^{ u_{D}^{*}} A^{ u_{D}^{*}} V^{ u_{M}^{*}} A^{ u_{M}^{*}} A^{ u_{M}^{*}}$	$ \begin{array}{r} -\frac{1}{2} + 2\sin^2\theta_W \\ -\frac{1}{2} \\ +\frac{1}{2} \\ +\frac{1}{2} \\ 0 \\ +1 \end{array} $	$ \begin{array}{r} -\frac{1}{2} + 2\sin^2\theta_W \\ +\frac{1}{2} \\ +\frac{1}{2} \\ -\frac{1}{2} \\ 0 \\ 1 \end{array} $	$-1 + 2\sin^2\theta_W$ 0 $+1$ 0 $-$

in the following table (for notation see Eq. (1) in "Standard Model of Electroweak Interactions"):

Here ν_D^* (ν_M^*) stands for Dirac (Majorana) excited neutrino. The corresponding couplings of excited quarks can be easily obtained. Although form factor effects can be present for the gauge couplings at $q^2 \neq 0$, they are usually neglected.

In addition, transition magnetic type couplings with a gauge boson are expected. These couplings can be generally parameterized as follows:

$$\mathcal{L} = \frac{\lambda_{\gamma}^{(f^{*})} e}{2m_{f^{*}}} \overline{f}^{*} \sigma^{\mu\nu} (\eta_{L} \frac{1-\gamma_{5}}{2} + \eta_{R} \frac{1+\gamma_{5}}{2}) f F_{\mu\nu} + \frac{\lambda_{Z}^{(f^{*})} e}{2m_{f^{*}}} \overline{f}^{*} \sigma^{\mu\nu} (\eta_{L} \frac{1-\gamma_{5}}{2} + \eta_{R} \frac{1+\gamma_{5}}{2}) f Z_{\mu\nu} + \frac{\lambda_{W}^{(\ell^{*})} g}{2m_{\ell^{*}}} \overline{\ell}^{*} \sigma^{\mu\nu} \frac{1-\gamma_{5}}{2} \nu W_{\mu\nu} + \frac{\lambda_{W}^{(\nu^{*})} g}{2m_{\nu^{*}}} \overline{\nu}^{*} \sigma^{\mu\nu} (\eta_{L} \frac{1-\gamma_{5}}{2} + \eta_{R} \frac{1+\gamma_{5}}{2}) \ell W_{\mu\nu}^{\dagger} + \text{h.c.}, \qquad (3)$$

HTTP://PDG.LBL.GOV

Created: 6/2/2004 14:08

where $g = e/\sin\theta_W$, $F_{\mu\nu} = \partial_{\mu}A_{\nu} - \partial_{\nu}A_{\mu}$ is the photon field strength, $Z_{\mu\nu} = \partial_{\mu}Z_{\nu} - \partial_{\nu}Z_{\mu}$, etc. The normalization of the coupling is chosen such that

$$\max(|\eta_L|, |\eta_R|) = 1 .$$

Chirality conservation requires

$$\eta_L \eta_R = 0 . (4)$$

Some experimental analyses assume the relation $\eta_L = \eta_R = 1$, which violates chiral symmetry. We encode the results of such analyses if the crucial part of the cross section is proportional to the factor $\eta_L^2 + \eta_R^2$ and the limits can be reinterpreted as those for chirality conserving cases $(\eta_L, \eta_R) = (1, 0)$ or (0, 1)after rescaling λ .

These couplings in Eq. (3) can arise from $SU(2) \times U(1)$ invariant higher-dimensional interactions. A well-studied model is the interaction of homodoublet type ℓ^* with the Lagrangian [2,3]

$$\mathcal{L} = \frac{1}{2\Lambda} \overline{L}^* \sigma^{\mu\nu} (g f \frac{\tau^a}{2} W^a_{\mu\nu} + g' f' Y B_{\mu\nu}) \frac{1 - \gamma_5}{2} L + \text{h.c.}, \quad (5)$$

where L denotes the lepton doublet (ν, ℓ) , Λ is the compositeness scale, g, g' are SU(2) and U(1)_Y gauge couplings, and $W^a_{\mu\nu}$ and $B_{\mu\nu}$ are the field strengths for SU(2) and U(1)_Y gauge fields. The same interaction occurs for mirror-type excited leptons. For sequential-type excited leptons, the ℓ^* and ν^* couplings become unrelated, and the couplings receive the extra suppression of $(250 \text{ GeV})/\Lambda$ or m_{L^*}/Λ . In any case, these couplings satisfy the relation

$$\lambda_W = -\sqrt{2}\sin^2\theta_W (\lambda_Z \cot\theta_W + \lambda_\gamma) . \tag{6}$$

HTTP://PDG.LBL.GOV Page 4 Created: 6/2/2004 14:08

Additional coupling with gluons is possible for excited quarks:

$$\mathcal{L} = \frac{1}{2\Lambda} \overline{Q}^* \sigma^{\mu\nu} \left(g_s f_s \frac{\lambda^a}{2} G^a_{\mu\nu} + g f \frac{\tau^a}{2} W^a_{\mu\nu} + g' f' Y B_{\mu\nu} \right) \\ \times \frac{1 - \gamma_5}{2} Q + \text{h.c.} , \qquad (7)$$

where Q denotes a quark doublet, g_s is the QCD gauge coupling, and $G^a_{\mu\nu}$ the gluon field strength.

It should be noted that the electromagnetic radiative decay of $\ell^*(\nu^*)$ is forbidden if f = -f' (f = f'). These two possibilities (f = f' and f = -f') are investigated in many analyses of the LEP experiments above the Z pole.

Several different conventions are used by LEP experiments on Z pole to express the transition magnetic couplings. To facilitate comparison, we re-express these in terms of λ_Z and λ_{γ} using the following relations and taking $\sin^2\theta_W = 0.23$. We assume chiral couplings, *i.e.*, |c| = |d| in the notation of Ref. 2.

1. ALEPH (charged lepton and neutrino)

$$\lambda_Z^{\text{ALEPH}} = \frac{1}{2} \lambda_Z \quad (1990 \text{ papers}) \tag{8a}$$

$$\frac{2c}{\Lambda} = \frac{\lambda_Z}{m_{\ell^*} [\text{or } m_{\nu^*}]} \quad (\text{for } |c| = |d|)$$
(8b)

2. ALEPH (quark)

$$\lambda_u^{\text{ALEPH}} = \frac{\sin \theta_W \cos \theta_W}{\sqrt{\frac{1}{4} - \frac{2}{3} \sin^2 \theta_W + \frac{8}{9} \sin^4 \theta_W}} \lambda_Z = 1.11 \lambda_Z \quad (9)$$

3. L3 and DELPHI (charged lepton)

$$\lambda^{\text{L3}} = \lambda_Z^{\text{DELPHI}} = -\frac{\sqrt{2}}{\cot \theta_W - \tan \theta_W} \ \lambda_Z = -1.10\lambda_Z \ (10)$$

Citation: S. Eidelman et al. (Particle Data Group), Phys. Lett. B 592, 1 (2004) (URL: http://pdg.lbl.gov)

4. L3 (neutrino)

$$f_Z^{\rm L3} = \sqrt{2}\lambda_Z \tag{11}$$

5. OPAL (charged lepton)

$$\frac{f^{\text{OPAL}}}{\Lambda} = -\frac{2}{\cot\theta_W - \tan\theta_W} \frac{\lambda_Z}{m_{\ell^*}} = -1.56 \frac{\lambda_Z}{m_{\ell^*}} \qquad (12)$$

6. OPAL (quark)

$$\frac{f^{\text{OPAL}}c}{\Lambda} = \frac{\lambda_Z}{2m_{q^*}} \quad (\text{for } |c| = |d|) \tag{13}$$

7. DELPHI (charged lepton)

$$\lambda_{\gamma}^{\text{DELPHI}} = -\frac{1}{\sqrt{2}} \lambda_{\gamma} \tag{14}$$

If leptons are made of color triplet and antitriplet constituents, we may expect their color-octet partners. Transitions between the octet leptons (ℓ_8) and the ordinary lepton (ℓ) may take place via the dimension-five interactions

$$\mathcal{L} = \frac{1}{2\Lambda} \sum_{\ell} \left\{ \overline{\ell}_8^{\alpha} g_S F^{\alpha}_{\mu\nu} \sigma^{\mu\nu} \left(\eta_L \ell_L + \eta_R \ell_R \right) + h.c. \right\}$$
(15)

where the summation is over charged leptons and neutrinos. The leptonic chiral invariance implies $\eta_L \ \eta_R = 0$ as before.

>2.5	>2.2		⁶ HOWELL	92	TOPZ	E _{cm} =52–61.4 GeV
>3.4	>2.7	95 ²	⁷ KROHA	92	RVUE	

 22 BABICH 03 obtain a bound $-0.175~\text{TeV}^{-2} < 1/\Lambda_{LL}^2 < 0.095~\text{TeV}^{-2}$ (95%CL) in a model independent analysis allowing all of Λ_{LL} , Λ_{LR} , Λ_{RL} , Λ_{RR} to coexist.

²³ From $e^+e^- \rightarrow e^+e^-$, $\mu^+\mu^-$, and $\tau^+\tau^-$.

 24 BUSKULIC 93Q uses the following prescription to obtain the limit: when the naive 95%CL limit is better than the statistically expected sensitivity for the limit, the latter is adopted for the limit.

²⁵ This BUSKULIC 93Q value is from ALEPH data plus PEP/PETRA/TRISTAN data reanalyzed by KROHA 92.

²⁶ HOWELL 92 limit is from $e^+e^- \rightarrow \mu^+\mu^-$ and $\tau^+\tau^-$. ²⁷ KROHA 92 limit is from fit to most PEP/PETRA/TRISTAN data. The fit gives η/Λ_{II}^2 $= -0.0200 \pm 0.0666 \text{ TeV}^{-2}$

SCALE LIMITS for Contact Interactions: $\Lambda(eeqq)$ Limits are for Λ_{LL}^{\pm} only. For other cases, see each reference.

²⁸ CHEUNG 01B is an update of BARGER 98E.

- 29 BARATE 001 limits are from R_b and jet-charge asymmetry at 130–183 GeV.
- ³⁰ABREU 99A limits are from flavor-tagged $e^+e^- \rightarrow q \overline{q}$ cross section at 130–172 GeV. ³¹ADLOFF 03 limits are from the $d\sigma/dQ^2$ measurement of $e^{\pm}p \rightarrow e^{\pm}X$.
- ³²ACHARD 02J limit is from the bound on the $e^+e^- \rightarrow t \overline{c}$ cross section. $\Lambda_{LL} = \Lambda_{LR}$ $= \Lambda_{RL} = \Lambda_{RR}$ and $m_t = 175$ GeV are assumed.
- ³³ABBIENDI 00R limits are from $e^+e^- \rightarrow q \overline{q}$ cross section at \sqrt{s} = 130–189 GeV.
- ³⁴ ACCIARRI 00P limit is from $e^+e^- \rightarrow qq$ cross section at \sqrt{s} =130–189 GeV.
- ³⁵ ADLOFF 00 limits are from the Q^2 spectrum measurement of $e^+ p \rightarrow e^+ X$.
- ³⁶BARATE 001 limits are from $e^+e^- \rightarrow q \overline{q}$ cross section and jet-charge asymmetry at 130-183 GeV.
- ³⁷ BREITWEG 00B limits are from Q^2 spectrum measurement of $e^+ p$ collisions. See their Table 3 for the limits of various models. ³⁸ ABBIENDI 99 limits are from $e^+e^- \rightarrow q \overline{q}$ cross section at 130–136, 161–172, 183
- GeV. 39 ABBIENDI 99 limits are from R_b at 130–136, 161–172, 183 GeV.
- ⁴⁰ABBOTT 99D limits are from e^+e^- mass distribution in $p\overline{p} \rightarrow e^+e^-X$ at $E_{cm}=$ 1.8 TeV. ⁴¹ ZARNECKI 99 use data from HERA, LEP, Tevatron, and various low-energy experiments.
- ⁴² ACCIARRI 98J limits are from $e^+e^- \rightarrow q \overline{q}$ cross section at $E_{\rm cm} = 130$ –172 GeV.
- ⁴³ACKERSTAFF 98V limits are from $e^+e^- \rightarrow q \overline{q}$ at $E_{\rm cm} = 130$ –172 GeV.
- ⁴⁴ ACKERSTAFF 98V limits are from R_b measurements at $E_{\rm cm}$ = 130–172 GeV.
- ⁴⁵ BARGER 98E use data from HERA, LEP, Tevatron, and various low-energy experiments.
- ⁴⁶ABE 97T limits are from e^+e^- mass distribution in $\overline{p}p \rightarrow e^+e^-X$ at E_{cm} =1.8 TeV. ⁴⁷ ACKERSTAFF 97C limits are from $e^+e^- \rightarrow q \overline{q}$ cross section at $E_{\rm cm} = 130-136$ GeV
- and 161 GeV. $^{\rm 48}\rm ACKERSTAFF$ 97C limits are R_b measurements at $E_{\rm cm}=$ 133 GeV and 161 GeV.
- ⁴⁹ DEANDREA 97 limit is from atomic parity violation of cesium. The limit is eluded if the contact interactions are parity conserving.
- 50 AID 95 limits are from the Q^2 spectrum measurement of $e p \rightarrow e X$.
- ⁵¹ABE 91D limits are from e^+e^- mass distribution in $p\overline{p} \rightarrow e^+e^-$ X at $E_{cm} = 1.8$ TeV.

⁵² ADACHI 91 limits are from differential jet cross section. Universality of $\Lambda(eeqq)$ for five flavors is assumed. 53 BEHREND 91C is from data at $E_{\rm cm} = 35$ –43 GeV.

- ⁵⁴ ABE 89L limits are from jet charge asymmetry. Universality of $\Lambda(eeqq)$ for five flavors is assumed. ⁵⁵ The HAGIWARA 89 limit is derived from forward-backward asymmetry measurements of
- D/D^* mesons by ALTHOFF 83C, BARTEL 84E, and BARINGER 88.
- 56 The HAGIWARA 89 limit is derived from forward-backward asymmetry measurement of b hadrons by BARTEL 84D.

>0.275	95	⁷⁶ BAGNAIA	84C UA2	Repl. by APPEL 85

⁶² The quoted limit is from inclusive dijet mass spectrum in $p\overline{p}$ collisions at E_{cm} =1.8 TeV. ABBOTT 99C also obtain $\Lambda_{II}^- > 2.4$ TeV. All quarks are assumed composite.

- ⁶³ The quoted limit for ABBOTT 00E is from H_T distribution in $p\overline{p}$ collisions at $E_{\rm cm}$ =1.8 TeV. CTEQ4M PDF and $\mu = E_T^{\rm max}$ are assumed. For limits with different assumptions, see their Tables 2 and 3. All quarks are assumed composite.
- ⁶⁴ ABBOTT 98G limit is from dijet angular distribution in $p\overline{p}$ collisions at $E_{cm} = 1.8$ TeV. All quarks are assumed composite.
- 65 BERTRAM 98 obtain limit on the scale of color-octet axial-vector flavor-universal contact interactions: $\Lambda_{A8} > 2.1$ TeV. They also obtain a limit $\Lambda_{V8} > 2.4$ TeV on a color-octet flavor-universal vectorial contact interaction. 66 ABE 96 finds that the inclusive jet cross section for $E_{\mathcal{T}} > 200$ GeV is significantly higher
- ⁰⁰ ABE 96 finds that the inclusive jet cross section for $E_T > 200$ GeV is significantly higher than the $\mathcal{O}(\alpha_s^3)$ perturbative QCD prediction. This could be interpreted as the effect of a contact interaction with $\Lambda_{LL} \sim 1.6$ TeV. However, ABE 96 state that uncertainty in the parton distribution functions, higher-order QCD corrections, and the detector calibration may possibly account for the effect.
- ⁶⁷ ABE 96S limit is from dijet angular distribution in $p\overline{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit for Λ_{LL}^- is > 1.4 TeV. ABE 96S also obtain limits for flavor symmetric contact interactions among all quark flavors: $\Lambda_{LL}^+ > 1.8$ TeV and $\Lambda_{LL}^- > 1.6$ TeV.
- ⁶⁸ABE 93G limit is from dijet mass distribution in $p\overline{p}$ collisions at $E_{\rm cm} = 1.8$ TeV. The limit is the weakest from several choices of structure functions and renormalization scale.
- ⁶⁹Limit is from inclusive jet cross-section data in $p\overline{p}$ collisions at $E_{\rm cm} = 1.8$ TeV. The limit takes into account uncertainties in choice of structure functions and in choice of process scale.
- ⁷⁰ABE 92M limit is from dijet angular distribution for $m_{\text{dijet}} > 550$ GeV in $p\overline{p}$ collisions at $E_{\text{cm}} = 1.8$ TeV.
- ⁷¹ ALITTI 91B limit is from inclusive jet cross section in $p\overline{p}$ collisions at $E_{\rm cm} = 630$ GeV. The limit takes into account uncertainties in choice of structure functions and in choice of process scale.
- ⁷² ABE 89H limit is from dijet angular distribution for $m_{\text{dijet}} > 200$ GeV at the Fermilab Tevatron Collider with $E_{\text{cm}} = 1.8$ TeV. The QCD prediction is quite insensitive to choice of structure functions and choice of process scale.
- ⁷³ ARNISON 86C limit is from the study of inclusive high- p_T jet distributions at the CERN $\overline{p}p$ collider ($E_{cm} = 546$ and 630 GeV). The QCD prediction renormalized to the low- p_T region gives a good fit to the data.
- ⁷⁴ ARNISON 86D limit is from the study of dijet angular distribution in the range 240 < m(dijet) < 300 GeV at the CERN $\overline{p}p$ collider ($E_{cm} = 630$ GeV). QCD prediction using EHLQ structure function (EICHTEN 84) with $\Lambda_{QCD} = 0.2$ GeV for the choice of $Q^2 =$

 p_T^2 gives the best fit to the data.

- ⁷⁵ APPEL 85 limit is from the study of inclusive high- p_T jet distributions at the CERN $\overline{p}p$ collider ($E_{cm} = 630$ GeV). The QCD prediction renormalized to the low- p_T region gives a good description of the data.
- ⁷⁶ BAGNAIA 84C limit is from the study of jet p_T and dijet mass distributions at the CERN $\overline{p}p$ collider ($E_{\rm cm} = 540$ GeV). The limit suffers from the uncertainties in comparing the data with the QCD prediction.

SCALE LIMITS for Contact Interactions: $\Lambda(\nu \nu q q)$

Limits are for Λ_{LL}^{\pm} only. For other cases, see each reference.

77 MCE/		2 accumo	d a flavor universal inter	action	Neutrinos were mostly of m

'' MCFARLAND 98 assumed a flavor universal interaction. Neutrinos were mostly of muon type.

MASS LIMITS for Excited $e(e^*)$

Most e^+e^- experiments assume one-photon or Z exchange. The limits from some e^+e^- experiments which depend on λ have assumed transition couplings which are chirality violating ($\eta_L = \eta_R$). However they can be interpreted as limits for chirality-conserving interactions after multiplying the coupling value λ by $\sqrt{2}$; see Note.

Excited leptons have the same quantum numbers as other ortholeptons. See also the searches for ortholeptons in the "Searches for Heavy Leptons" section.

Limits for Excited $e(e^*)$ from Pair Production

These limits are obtained from $e^+e^- \rightarrow e^{*+}e^{*-}$ and thus rely only on the (electroweak) charge of e^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the e^* coupling is assumed to be of sequential type. Possible t channel contribution from transition magnetic coupling is neglected. All limits assume a dominant $e^* \rightarrow e\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45**, 1 June, Part II (1992)).

- ⁸⁸ ABREU 97B also obtain limit from charged current decay mode $e^* \rightarrow \nu W$, $m_{e^*} > 44.6$ or GeV.

⁸⁹ ACKERSTAFF 97 also obtain limit from charged current decay mode $e^* \rightarrow \nu W$, $m_{\nu_e^*} > 77.1$ GeV/

- ^{77.1} GeV. ⁹⁰ From e^+e^- collisions at \sqrt{s} = 130–136 GeV.
- ⁹¹ From e^+e^- collisions at \sqrt{s} = 130–140 GeV.
- 92 BARDADIN-OTWINOWSKA 92 limit is independent of decay modes. Based on $\Delta\Gamma(Z){<}36$ MeV.
- ⁹³Limit is independent of e^* decay mode.
- ⁹⁴ ADEVA 90F is superseded by ADRIANI 93M.
- ⁹⁵ Superseded by DECAMP 92.
- ⁹⁶ ABE 88B limits assume $e^+e^- \rightarrow e^{*+}e^{*-}$ with one photon exchange only and $e^* \rightarrow e\gamma$ giving $ee\gamma\gamma$.

Limits for Excited $e(e^*)$ from Single Production

These limits are from $e^+e^- \rightarrow e^*e$, $W \rightarrow e^*\nu$, or $ep \rightarrow e^*X$ and depend on transition magnetic coupling between e and e^* . All limits assume $e^* \rightarrow e\gamma$ decay except as noted. Limits from LEP, UA2, and H1 are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda - m_{e^*}$ plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review **D45**, 1 June, Part II (1992)).

 $^{122}\,{\rm Superseded}$ by ADRIANI 93M.

¹²³ Superseded by DECAMP 92.

- ¹²⁴ABE 88B limits use $e^+e^- \rightarrow ee^*$ where t-channel photon exchange dominates giving $e\gamma(e)$ (quasi-real compton scattering).
- ¹²⁵ ANSARI 87D is at $E_{\rm cm} = 546-630$ GeV.

Limits for Excited $e~(e^*)$ from $e^+e^- ightarrow~\gamma\gamma$

These limits are derived from indirect effects due to e^* exchange in the t channel and depend on transition magnetic coupling between e and e^* . All limits are for $\lambda_{\gamma}=1$. All limits except ABE 89J and ACHARD 02D are for nonchiral coupling with $\eta_L=\eta_R=1$. We choose the chiral coupling limit as the best limit and list it in the Summary Table.

For limits prior to 1987, see our 1992 edition (Physical Review **D45**, 1 June, Part II (1992)).

- $^{126}\,{\rm ACCIARRI}$ 00G also obtain a limit on e^* with chiral coupling, $m_{e^*}>213$ GeV.
- ¹²⁷ BARATE 98U is from e^+e^- collision at $\sqrt{s}=M_Z$. See their Fig. 5 for limits in masscoupling plane
- ¹²⁸ ACCIARRI 97W also obtain a limit on e^* with chiral coupling, $m_{e^*} > 157$ GeV (95%CL).
- 129 BUSKULIC 93Q obtain Λ^+ >121 GeV (95%CL) from ALEPH experiment and Λ^+ >135 GeV from combined TRISTAN and ALEPH data. These limits roughly correspond to limits on m_{ρ^*} .
- ¹³⁰ ADRIANI 92B superseded by ACCIARRI 95G.
- ¹³¹ BARDADIN-OTWINOWSKA 92 limit from fit to the combined data of DECAMP 92, ABREU 91E, ADEVA 90K, AKRAWY 91F.
- $^{132}\,{\rm SHIMOZAWA}$ 92 fit the data to the limiting form of the cross section with $m_{e^*} \gg E_{\rm cm}$ and obtain $m_{e^*} > 168~{\rm GeV}$ at 95%CL. Use of the full form would reduce this limit by a few GeV. The statistically unexpected large value is due to fluctuation in the data.
- 133 The ABE 89J limit assumes chiral coupling. This corresponds to λ_{γ} = 0.7 for nonchiral coupling.

Indirect Limits for Excited $e(e^*)$

These limits make use of loop effects involving e^* and are therefore subject to theoretical uncertainty.

VALUE (GeV)	DOCUMENT ID		TECN COMMENT	
• • • We do not use th	e following data for averages			
	¹³⁴ DORENBOS	89	CHRM $\overline{\nu}_{\mu} e \rightarrow \overline{\nu}_{\mu} e e \rightarrow \nu e$	e and
	¹³⁵ GRIFOLS	86	THEO $ u_{\mu} e \rightarrow \nu_{\mu} e$	4
	¹³⁶ RENARD	82	THEO $g-2$ of electron	ron
124	2 2 2	`		

¹³⁴ DORENBOSCH 89 obtain the limit $\lambda_{\gamma}^2 \Lambda_{\rm cut}^2 / m_{e^*}^2 < 2.6$ (95% CL), where $\Lambda_{\rm cut}$ is the cutoff scale, based on the one-loop calculation by GRIFOLS 86. If one assumes that $\Lambda_{\rm cut} = 1$ TeV and $\lambda_{\gamma} = 1$, one obtains $m_{e^*} > 620$ GeV. However, one generally expects $\lambda_{\gamma} \approx m_{e^*} / \Lambda_{\rm cut}$ in composite models.

- ¹³⁵ GRIFOLS 86 uses $\nu_{\mu}e \rightarrow \nu_{\mu}e$ and $\overline{\nu}_{\mu}e \rightarrow \overline{\nu}_{\mu}e$ data from CHARM Collaboration to derive mass limits which depend on the scale of compositeness.
- ¹³⁶ RENARD 82 derived from g-2 data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.

MASS LIMITS for Excited μ (μ^*)

Limits for Excited μ (μ^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow \mu^{*+}\mu^{*-}$ and thus rely only on the (electroweak) charge of μ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the μ^* coupling is assumed to be of sequential type. All limits assume a dominant $\mu^* \rightarrow \mu\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45**, 1 June, Part II (1992)).

- 146 ABREU 97B also obtain limit from charged current decay mode $\mu^* o ~
 u$ W, $m_{\mu^*} >$ 70.9 GeV.

¹⁴⁷ ABREU 97B also obtain limit from charged current decay mode $\mu^* \to \nu W$, $m_{\mu^*} >$ 44.6 GeV.

¹⁴⁸ ACKERSTAFF 97 also obtain limit from charged current decay mode $\mu^* \rightarrow \nu W$, $m_{\nu^*} > 77.1 \text{ GeV}.$

¹⁴⁹ From e^+e^- collisions at \sqrt{s} = 130–136 GeV.

¹⁵⁰ From e^+e^- collisions at \sqrt{s} = 130–140 GeV.

 151 BARDADIN-OTWINOWSKA 92 limit is independent of decay modes. Based on $\Delta\Gamma(Z){<}36$ MeV.

¹⁵²Limit is independent of μ^* decay mode.

¹⁵³ Superseded by ADRIANI 93M.

¹⁵⁴ Superseded by DECAMP 92.

Limits for Excited μ (μ^*) from Single Production

These limits are from $e^+e^- \rightarrow \mu^*\mu$ and depend on transition magnetic coupling between μ and μ^* . All limits assume $\mu^* \rightarrow \mu\gamma$ decay. Limits from LEP are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda - m_{\mu^*}$ plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review **D45**, 1 June, Part II (1992)).

	¹⁷³ RENARD	82 THE	EO $g-2$ of muon

¹⁷³RENARD 82 derived from g-2 data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.

MASS LIMITS for Excited τ (τ^*)

Limits for Excited τ (τ^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow \tau^{*+}\tau^{*-}$ and thus rely only on the (electroweak) charge of τ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the τ^* coupling is assumed to be of sequential type. All limits assume a dominant $\tau^* \rightarrow \tau \gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review D45, 1 June, Part II (1992)).

Limits for Excited τ (τ^*) from Single Production

These limits are from $e^+e^- \rightarrow \tau^*\tau$ and depend on transition magnetic coupling between τ and τ^* . All limits assume $\tau^* \rightarrow \tau\gamma$ decay. Limits from LEP are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda - m_{\tau^*}$ plane. See the original papers.

²¹² From e^+e^- collisions at $\sqrt{s} = 189-209$ GeV. f = -f' is assumed. ACHARD 03B also obtain limit for f = f': $m_{\nu_e^*} > 101.7$ GeV, $m_{\nu_\mu^*} > 101.8$ GeV, and $m_{\nu_\tau^*} > 92.9$ GeV. See their Fig. 4 for the exclusion plot in the mass-coupling plane.

²¹³ From e^+e^- collisions at $\sqrt{s} = 192-202$ GeV. f=f' is assumed. ACCIARRI 01D also

obtain limit for f=-f': $m_{\nu_e^*} > 99.1$ GeV, $m_{\nu_\mu^*} > 99.3$ GeV, $m_{\nu_\tau^*} > 90.5$ GeV.

²¹⁴ From e^+e^- collisions at \sqrt{s} =161–183 GeV. f=-f' (photonic decay) is assumed. AB-BIENDI 001 also obtain limit for f=f' ($\nu^* \rightarrow \ell W$): $m_{\nu_e^*} > 91.1$ GeV, $m_{\nu_\mu^*} > 83.1$ GeV.

²¹⁵ From e^+e^- collisions at $\sqrt{s}=$ 189 GeV. ABBIENDI,G 00D obtain limit on $\sigma(e^+e^- \rightarrow \nu^*\nu^*)B(\nu^* \rightarrow \nu\gamma)^2$. See their Fig. 14. The limit ranges from 50 to 80 fb for $\sqrt{s}/2=$ 95 GeV> $m_{\nu^*}>$ 45 GeV.

²¹⁶ From e^+e^- collisions at $\sqrt{s}=189$ GeV. f=-f' (photonic decay) is assumed. ACCIA-RRI 00E also obtain limit for f=f' ($\nu^* \rightarrow \ell W$): $m_{\nu_e^*} > 93.9$ GeV, $m_{\nu_\mu^*} > 94.0$ GeV, $m_{\mu} > 91.5$ GeV

$$m_{\nu_{-}^{*}}^{*}$$
 > 91.5 GeV

²¹⁷ From e^+e^- collisions at \sqrt{s} = 130–183 GeV, ABBIENDI 99F obtain limit on $\sigma(e^+e^- \rightarrow \nu^*\nu^*) B(\nu^* \rightarrow \nu\gamma)^2$. See their Fig. 13. The limit ranges from 0.094 to 0.14 pb for $\sqrt{s}/2 > m_{\nu^*} > 45$ GeV.

²¹⁸ From e^+e^- collisions at \sqrt{s} = 183 GeV. f=-f' is assumed. ABREU 990 also obtain limit for f=f': $m_{\nu_{e^*}} > 87.3$ GeV, $m_{\nu_{\mu^*}} > 88.0$ GeV, $m_{\nu_{\tau^*}} > 81.0$ GeV.

- ²¹⁹ From e^+e^- collisions at \sqrt{s} =170–172 GeV. ACKERSTAFF 98C also obtain limit from charged decay modes: $m_{\nu_e^*} > 84.1$ GeV, $m_{\nu_{\mu}^*} > 83.9$ GeV, and $m_{\nu_{\pi}^*} > 79.4$ GeV.
- ²²⁰ BARATE 98U obtain limits on the form factor. See their Fig. 14 for limits in mass-form factor plane.

²²¹ From e^+e^- collisions at $\sqrt{s}=$ 161 GeV.

- ²²²ABREU 97B also obtain limits from charged current decay modes, $m_{\mu^*} > 56.4$ GeV.
- $^{223}\text{ABREU}$ 97B also obtain limits from charged current decay modes, $m_{\nu^*}^{} >$ 44.9 GeV.
- ²²⁴ ACCIARRI 97G also obtain limits from charged current decay mode $\nu_e^* \rightarrow eW$, $m_{\nu^*} >$
- $^{64.5}$ GeV. $^{225}_{\rm ACKERSTAFF}$ 97 also obtain limits from charged current decay modes $m_{\nu_e^*}^{} >$ 78.3

GeV, $m_{\nu_{..}^{*}}^{}>$ 78.9 GeV, $m_{\nu_{\tau}^{*}}^{}>$ 76.2 GeV.

²²⁶ From e^+e^- collisions at \sqrt{s} = 130–140 GeV.

²²⁷ ACCIARRI 96D also obtain limit from $\nu^* \rightarrow eW$ decay mode: $m_{\mu^*} > 57.3$ GeV.

²²⁸ From e^+e^- collisions at \sqrt{s} = 130–136 GeV.

 229 ALEXANDER 96Q also obtain limits from charged current decay modes: $m_{\nu^*} > 66.2$

GeV, $m_{\nu_{IL}^*}^{} > 66.5$ GeV, $m_{\nu_{\tau}^*}^{} > 64.7$ GeV.

 230 BARDADIN-OTWINOWSKA 92 limit is for Dirac ν^* . Based on $\Delta\Gamma(Z)$ <36 MeV. The limit is 36.4 GeV for Majorana ν^* , 45.4 GeV for homodoublet ν^* . ²³¹Limit is based on B($Z \rightarrow \nu^* \overline{\nu}^*$)×B($\nu^* \rightarrow \nu \gamma$)² < 5 × 10⁻⁵ (95%CL) assuming

- Dirac ν^* , B($\nu^* \rightarrow \nu \gamma$) = 1.
- ²³² Limit is for Dirac ν^* . The limit is 34.6 GeV for Majorana ν^* , 45.4 GeV for homodoublet ν^* .
- ²³³ DECAMP 900 limit is from excess $\Delta\Gamma(Z) < 89$ MeV. The above value is for Dirac ν^* ; 26.6 GeV for Majorana ν^* ; 44.8 GeV for homodoublet ν^* .
- ²³⁴ Superseded by DECAMP 92.

²³⁵ DECAMP 900 limit based on B($Z \rightarrow \nu^* \nu^*$)·B($\nu^* \rightarrow \nu \gamma$)² < 7 × 10⁻⁵ (95%CL), assuming Dirac ν^* , B($\nu^* \rightarrow \nu \gamma$) = 1.

Limits for Excited ν (ν^*) from Single Production

These limits are from $e^+e^- \rightarrow \nu \nu^*$, $Z \rightarrow \nu \nu^*$, or $ep \rightarrow \nu^* X$ and depend on transition magnetic coupling between ν/e and ν^* . Assumptions about ν^* decay mode are given in footnotes.

²³⁶ ACHARD 03B result is from e^+e^- collisions at $\sqrt{s} = 189-209$ GeV. The quoted limit is for ν_e^* . $f = -f' = \Lambda/m_{\nu^*}$ is assumed. See their Fig. 4 for the exclusion plot in the mass-coupling plane.

²³⁷ ADLOFF 02 search for single ν^* production in ep collisions with the decays $\nu^* \rightarrow \nu \gamma$, νZ , eW. The quoted limit assumes $f = -f' = \Lambda/m_{\nu^*}$. See their Fig. 1 for the exclusion plots in the mass-coupling plane.

²³⁸ CHEKANOV 02D search for single ν^* production in ep collisions with the decays $\nu^* \rightarrow \nu\gamma$, νZ , eW. $f = -f' = \Lambda/m_{\nu^*}$ is assumed for the e^* coupling. CHEKANOV 02D also obtain limit for $f = f' = \Lambda/m_{\nu^*}$: $m_{\nu^*} > 135$ GeV. See their Fig. 5c and Fig. 5d for the exclusion plot in the mass-coupling plane.

²³⁹ ACCIARRI 01D search for $\nu\nu^*$ production in e^+e^- collisions at $\sqrt{s} = 192-202$ GeV with decays $\nu^* \rightarrow \nu\gamma$, $\nu^* \rightarrow eW$. $f=-f'=\Lambda/m_{\nu^*}$ is assumed for the ν^* coupling. See their Fig. 4 for limits in the mass-coupling plane.

²⁴⁰ ABBIENDI 001 result is from e^+e^- collisions at \sqrt{s} =161–183 GeV. See their Fig. 7 for limits in mass-coupling plane.

- ²⁴¹ From e^+e^- collisions at $\sqrt{s}=$ 189 GeV. ABBIENDI,G 00D obtain limit on $\sigma(e^+e^- \rightarrow \nu^*\nu^*)B(\nu^* \rightarrow \nu\gamma)^2$. See their Fig. 11.
- ²⁴² ACCIARRI 00E result is from e^+e^- collisions at \sqrt{s} =189 GeV. See their Fig. 3 for limits in mass-coupling plane.
- ²⁴³ ADLOFF 00E search for single ν^* production in ep collisions with the decays $\nu^* \rightarrow \nu \gamma$, νZ , eW. The quoted limit assumes $f=-f'=\Lambda/m_{\nu^*}$. See their Fig. 10 for the exclusion plot in the mass-coupling plane.
- ²⁴⁴ From e^+e^- collisions at $\sqrt{s}=$ 130–183 GeV, ABBIENDI 99F obtain limit on $\sigma(e^+e^- \rightarrow \nu\nu^*)$ B($\nu^* \rightarrow \nu\gamma$). See their Fig. 8.
- ²⁴⁵ ABREU 990 result is from e^+e^- collisions at $\sqrt{s}=$ 183 GeV. See their Figs. 4 and 5 for the exclusion limit in the mass-coupling plane.
- ²⁴⁶ ACKERSTAFF 98C from e^+e^- collisions at \sqrt{s} =170–172 GeV. See their Fig. 11 for the exclusion limit in the mass-coupling plane.
- 247 BARATE 98U obtain limits on the $Z\nu\nu^*$ coupling. See their Fig. 13 for limits in mass-coupling plane

²⁴⁸ From e^+e^- collisions at $\sqrt{s}=$ 161 GeV.

- ²⁴⁹ See Fig. 4b and Fig. 5b of ABREU 97B for the exclusion limit in the mass-coupling plane.
- ²⁵⁰ ABREU 971 limit is from $Z \rightarrow \nu \nu^*$. See their Fig. 12 for the exclusion limit in the mass-coupling plane.
- ²⁵¹ABREU 97J limit is from $Z \rightarrow \nu \nu^*$. See their Fig. 5 for the exclusion limit in the mass-coupling plane.
- 252 See Fig. 2 and Fig. 3 of ACCIARRI 97G for the exclusion limit in the mass-coupling plane.
- ²⁵³ ACKERSTAFF 97 result is from e^+e^- collisions at $\sqrt{s}=$ 161 GeV, for homodoublet ν^* . See their Fig. 3 for the exclusion limit in the mass-coupling plane.
- ²⁵⁴ ADLOFF 97 search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma$, eZ, νW . See their Fig. 4 for the rejection limits on the product of the production cross section and the branching ratio.
- ²⁵⁵ BREITWEG 97C search for single ν^* production in ep collisions with the decay $\nu^* \rightarrow \nu\gamma$. $f=-f'=2\Lambda/m_{\nu^*}$ is assumed for the ν^* coupling. See their Fig. 10 for the exclusion plot in the mass-coupling plane.
- ²⁵⁶ ACCIARRI 96D result is from e^+e^- collisions at $\sqrt{s}=$ 130–140 GeV. See their Fig. 2 for the exclusion limit in the mass-coupling plane.
- ²⁵⁷ ALEXANDER 96Q result is from e^+e^- collisions at $\sqrt{s}=$ 130–140 GeV for homodoublet ν^* . See their Fig. 3b and Fig. 3c for the exclusion limit in the mass-coupling plane.
- ²⁵⁸ BUSKULIC 96W result is from e^+e^- collisions at \sqrt{s} = 130–140 GeV. See their Fig. 4 for the exclusion limit in the mass-coupling plane.
- ²⁵⁹ DERRICK 95B search for single ν^* production via $\nu^* eW$ coupling in ep collisions with the decays $\nu^* \rightarrow \nu\gamma$, νZ , eW. See their Fig. 14 for the exclusion plot in the $m_{\nu^*}^{} \lambda\gamma$ plane.
- ²⁶⁰ABT 93 search for single ν^* production via $\nu^* eW$ coupling in ep collisions with the decays $\nu^* \rightarrow \nu\gamma$, νZ , eW. See their Fig. 4 for exclusion plot in the $m_{\nu^*} \lambda_W$ plane.
- ²⁶¹ See Fig. 5 of BARDADIN-OTWINOWSKA 92 for combined limit of ADEVA 900, DE-CAMP 900, and DECAMP 92.
- ²⁶² DECAMP 92 limit is based on B($Z \rightarrow \nu^* \overline{\nu}$)×B($\nu^* \rightarrow \nu \gamma$) < 2.7 × 10⁻⁵ (95%CL) assuming Dirac ν^* , B($\nu^* \rightarrow \nu \gamma$) = 1.

²⁶³Limit is either for $\nu^* \rightarrow \nu \gamma$ or $\nu^* \rightarrow eW$.

²⁶⁴ Superseded by ADRIANI 93M.

²⁶⁵ DECAMP 900 limit based on B($Z \rightarrow \nu \nu^*$)·B($\nu^* \rightarrow \nu \gamma$) < 6 × 10⁻⁵ (95%CL), assuming B($\nu^* \rightarrow \nu \gamma$) = 1.

²⁶⁶ Superseded by DECAMP 92.

MASS LIMITS for Excited $q(q^*)$

Limits for Excited $q(q^*)$ from Pair Production

These limits are obtained from $e^+e^- \rightarrow q^*\overline{q}^*$ and thus rely only on the (electroweak) charge of the q^* . Form factor effects are ignored unless noted. Assumptions about the q^* decay are given in the comments and footnotes.

		²⁹⁷ BARTEL	85K	JADE	jets $e_8: e^+e^- \rightarrow gg; R$

- ²⁹² ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color octet lepton is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. The limit improves to 99 GeV if it always fragments into a unit-charged hadron.
- ²⁹³ ABT 93 search for e_8 production via *e*-gluon fusion in *e p* collisions with $e_8 \rightarrow eg$. See their Fig. 3 for exclusion plot in the m_{e_8} - Λ plane for m_{e_8} = 35-220 GeV.
- $^{294}\,\rm KIM$ 90 is at $E_{\rm cm}$ = 50–60.8 GeV. The same assumptions as in BARTEL 87B are used.
- ²⁹⁵ KIM 90 result $(m_{e_8} \Lambda_M)^{1/2}$ > 178.4 GeV (95%CL, $\alpha_s = 0.16$ used) is subject to the same restriction as for BARTEL 85K.
- ²⁹⁶ BARTEL 87B is at $E_{\rm cm} = 46.3-46.78$ GeV. The limits assume ℓ_8 pair production cross sections to be eight times larger than those of the corresponding heavy lepton pair production.
- ²⁹⁷ In BARTEL 85K, *R* can be affected by $e^+e^- \rightarrow gg$ via e_q exchange. Their limit $m_{e_8} > 173$ GeV (CL=95%) at $\lambda = m_{e_8}/\Lambda_M = 1$ ($\eta_L = \eta_R = 1$) is not listed above because the cross section is sensitive to the product $\eta_L \eta_R$, which should be absent in ordinary theory with electronic chiral invariance.

MASS LIMITS for Color Octet Neutrinos (ν_8)

$\lambda \equiv m_{\ell_8}/\Lambda$						
VALUE (GeV)	<u>CL%</u>	DOCUMENT ID		TECN	COMMENT	
>110	90	²⁹⁸ BARGER	89	RVUE	$\nu_8: p\overline{p} \rightarrow \nu_8\overline{\nu}_8$	
• • • We do not use the following data for averages, fits, limits, etc. • • •						
none 3.8-29.8	95	²⁹⁹ KIM	90	AMY	$ u_{8}: \ e^+ e^- o$ acoplanar jets	
none 9–21.9	95	³⁰⁰ BARTEL	87 B	JADE	jets $ u_8: e^+e^- ightarrow$ acoplanar jets	
					Jets	

²⁹⁸ BARGER 89 used ABE 89B limit for events with large missing transverse momentum. Two-body decay $\nu_8 \rightarrow \nu_g$ is assumed.

²⁹⁹ KIM 90 is at $E_{\rm cm} = 50-60.8$ GeV. The same assumptions as in BARTEL 87B are used. ³⁰⁰ BARTEL 87B is at $E_{\rm cm} = 46.3-46.78$ GeV. The limit assumes the ν_8 pair production cross section to be eight times larger than that of the corresponding heavy neutrino pair production. This assumption is not valid in general for the weak couplings, and the limit can be sensitive to its SU(2)_L×U(1)_Y quantum numbers.
