

b

$$I(J^P) = 0(\frac{1}{2}^+)$$

Charge = $-\frac{1}{3}$ e Bottom = -1

b-QUARK MASS

The first value is the “running mass” $\overline{m}_b(\mu = \overline{m}_b)$ in the $\overline{\text{MS}}$ scheme, and the second value is the $1S$ mass, which is half the mass of the $\Upsilon(1S)$ in perturbation theory. For a review of different quark mass definitions and their properties, see EL-KHADRA 02. The $1S$ mass is better suited for use in analyzing B decays than the $\overline{\text{MS}}$ mass because it gives a stable perturbative expansion. We have converted masses in other schemes to the $\overline{\text{MS}}$ mass and $1S$ mass using two-loop QCD perturbation theory with $\alpha_s(\mu = \overline{m}_b) = 0.22$. The range 4.1–4.4 for the $\overline{\text{MS}}$ mass corresponds to 4.6–4.9 for the $1S$ mass and 4.7–5.0 GeV for the pole mass.

- ¹ BAUER 04 determine m_b , m_c and $m_b - m_c$ by a global fit to inclusive B decay spectra.
- ² HOANG 04 determines m_b (\bar{m}_b) from moments at order α_s^2 of the bottom production cross-section in $e^+ e^-$ annihilation.
- ³ MCNEILE 04 use lattice QCD with dynamical light quarks and a static heavy quark to compute the masses of heavy-light mesons.
- ⁴ BAUER 03 determine the b quark mass by a global fit to B decay observables. The experimental data includes lepton energy and hadron invariant mass moments in semileptonic $B \rightarrow X_c \ell \nu_\ell$ decay, and the inclusive photon spectrum in $B \rightarrow X_s \gamma$ decay. The theoretical expressions used are of order $1/m^3$, and $\alpha_s^2 \beta_0$.
- ⁵ BORDES 03 determines m_b using QCD finite energy sum rules to order α_s^2 .
- ⁶ CORCELLA 03 determines \bar{m}_b using sum rules computed to order α_s^2 . Includes charm quark mass effects.
- ⁷ DEDIVITIIS 03 use a quenched lattice computation of heavy-heavy and heavy-light meson masses.
- ⁸ EIDEMULLER 03 determines \bar{m}_b and \bar{m}_c using QCD sum rules.
- ⁹ ERLER 03 determines \bar{m}_b and \bar{m}_c using QCD sum rules. Includes recent BES data.
- ¹⁰ MAHMOOD 03 determines m_b^{1S} by a fit to the lepton energy moments in $B \rightarrow X_c \ell \nu_\ell$ decay. The theoretical expressions used are of order $1/m^3$ and $\alpha_s^2 \beta_0$. We have converted their result to the $\overline{\text{MS}}$ scheme.
- ¹¹ PENIN 02 determines \bar{m}_b from the spectrum of the γ system.
- ¹² ABBIENDI 01S find $\bar{m}_b(M_Z)$ to be 2.67 ± 0.4 GeV from an analysis of $Z \rightarrow b$ decays.
- ¹³ KUHN 01 uses an analysis of the $e^+ e^-$ total cross section to hadrons.
- ¹⁴ NARISON 01B uses pseudoscalar sum rules in the B and D meson channels.
- ¹⁵ PINEDA 01 uses the $\gamma(1S)$ system to determine the quark mass. The errors are due to theory, and the uncertainty in α_s .
- ¹⁶ BARATE 00V obtain the b quark mass $\bar{m}_b(M_Z) = 3.27 \pm 0.22(\text{stat}) \pm 0.22(\text{exp}) \pm 0.38(\text{had}) \pm 0.16(\text{thy})$ from an analysis of event shape variables in Z decays. We have converted this to $\mu = \bar{m}_b$.
- ¹⁷ HOANG 00 uses a NNLO calculation of the vacuum polarization function to determine spectral moments of the masses and electronic decay widths of the γ mesons.
- ¹⁸ LUCHA 00, PINEDA 00 obtain the b -quark mass from a perturbative calculation of the γ spectrum and decay widths to order α_s^4 .
- ¹⁹ BENEKE 99 uses a calculation of the $b\bar{b}$ production cross section and the mass of the γ meson at NNLO.
- ²⁰ BRANDENBURG 99 obtain a b -quark mass of $\bar{m}_b(M_Z) = 2.56 \pm 0.27 \pm 0.28 \pm 0.49$ from a study of three-jet events at the Z . We have converted this to $\mu = \bar{m}_b$.
- ²¹ HOANG 99 uses a NNLO calculation of the vacuum polarization function to determine spectral moments of the masses and electronic decay widths of the γ mesons.
- ²² MELNIKOV 99 compute the quark mass using γ sum rules at NNLO.
- ²³ PENIN 99 compute the quark mass using γ sum rules at NNLO.
- ²⁴ ABREU 98I determines the $\overline{\text{MS}}$ mass $\bar{m}_b = 2.67 \pm 0.25 \pm 0.34 \pm 0.27$ GeV at $\mu = M_Z$ from three jet heavy quark production at LEP. ABREU 98I have rescaled the result to $\mu = \bar{m}_b$ using $\alpha_s = 0.118 \pm 0.003$.
- ²⁵ KUEHN 98 uses a calculation of the vacuum polarization function, including resumming threshold effects, to determine spectral moments of the masses of the γ mesons. We have converted their extracted value of 4.75 ± 0.04 for the pole mass to the $\overline{\text{MS}}$ scheme.
- ²⁶ GIMENEZ 97 uses lattice computations of the B -meson propagator and the B -meson binding energy Λ in the HQET. Their systematic (second) error for the $\overline{\text{MS}}$ mass is an estimate of the effects of higher-order corrections in the matching of the HQET operators (renormalon effects).
- ²⁷ JAMIN 97 apply the QCD moment method to the γ system. They also find a pole mass of 4.60 ± 0.02 .
- ²⁸ RODRIGO 97 determines the $\overline{\text{MS}}$ mass $\bar{m}_b = 2.85 \pm 0.22 \pm 0.20 \pm 0.36$ GeV at $\mu = M_Z$ from three jet heavy quark production at LEP. We have rescaled the result.
