

**$\Lambda(1690)$   $D_{03}$**  $I(J^P) = 0(\frac{3}{2}^-)$  Status: \*\*\*

The measurements of the mass, width, and elasticity published before 1974 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

 **$\Lambda(1690)$  DECAY MODES**

Mode	Fraction ( $\Gamma_i/\Gamma$ )
$\Gamma_1$ $N\bar{K}$	20–30 %
$\Gamma_2$ $\Sigma \pi$	20–40 %
$\Gamma_3$ $\Lambda \pi \pi$	$\sim$ 25 %
$\Gamma_4$ $\Sigma \pi \pi$	$\sim$ 20 %
$\Gamma_5$ $\Lambda \eta$	
$\Gamma_6$ $\Sigma(1385)\pi$ , S-wave	

The above branching fractions are our estimates, not fits or averages.

## $\Lambda(1690)$ BRANCHING RATIOS

The sum of all the quoted branching ratios is more than 1.0. The two-body ratios are from partial-wave analyses, and thus probably are more reliable than the three-body ratios, which are determined from bumps in cross sections. Of the latter, the  $\Sigma\pi\pi$  bump looks more significant. (The error given for the  $\Lambda\pi\pi$  ratio looks unreasonably small.) Hardly any of the  $\Sigma\pi\pi$  decay can be via  $\Sigma(1385)$ , for then seven times as much  $\Lambda\pi\pi$  decay would be required. See "Sign conventions for resonance couplings" in the Note on  $\Lambda$  and  $\Sigma$  Resonances.

## **$\Lambda(1690)$ FOOTNOTES**

- <sup>1</sup> The two MARTIN 77 values are from a T-matrix pole and from a Breit-Wigner fit.  
Another  $D_{03}$   $\Lambda$  at 1966 MeV is also suggested by MARTIN 77, but is very uncertain.  
<sup>2</sup> BARTLEY 68 uses only cross-section data. The enhancement is not seen by PRE-VOST 71.
