¹ Uses $B_s \rightarrow \chi_{c1} K^+ K^-$ mode.				
² Uses $J/\psi \rightarrow \mu^+ \mu^-$, $\phi \rightarrow K^+ K^-$ decays, and observes 128 ± 13 events of $B_s^0 \rightarrow J/\psi \phi$.				
³ Uses $B_s^0 \rightarrow J/\psi \phi$ fully reconstructed decays.				
⁴ Uses exclusively reconstructed final states containing a $J/\psi \rightarrow \mu^+ \mu^-$ decays.				
⁵ From the decay $B_s \rightarrow J/\psi(1S) \phi$.				
⁶ From the decay $B_s \rightarrow D_s^- \pi^+$.				

$m_{B_s^0} - m_B$

m_B is the average of our B masses ($m_{B^\pm} + m_{B^0}$)/2.

¹ AALTONEN 11AP combines the fully reconstructed $B_s^0 \rightarrow D_s^- \pi^+$ decays and partially reconstructed $B_s^0 \rightarrow D_s X$ decays.

² Measured using $D_s \mu^+$ vertices.

³ Uses $D_s^- \ell^+$, and $\phi \ell^+$ vertices.

⁴ Measured using D_s hadron vertices.

⁵ Measured using $D_s^- \ell^+$ vertices.

⁶ ACKERSTAFF 98F use fully reconstructed $D_s^- \rightarrow \phi \pi^-$ and $D_s^- \rightarrow K^{*0} K^-$ in the inclusive B_s^0 decay.

⁷ Combined results from $D_s^- \ell^+$ and D_s hadron.

⁸ Measured using $\phi \ell$ vertices.

⁹ Measured using inclusive D_s vertices.

¹⁰ Combined result for the four ABREU 96F methods.

¹¹ Exclusive reconstruction of $B_s \rightarrow \psi \phi$.

¹² ABREU 94E uses the flight-distance distribution of D_s vertices, ϕ -lepton vertices, and $D_s \mu$ vertices.

$\Gamma_{B_s^0}$

"OUR EVALUATION" is an average performed by the Heavy Flavor Averaging Group (HFLAV) as described in our "Review on B - \bar{B} Mixing" in the B^0 section of these Listings. It includes the measurements of $\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ listed in this section, as well as constraints from effective lifetimes with pure CP modes and flavor-specific modes.

¹ Measured using time-dependent angular analysis of $B_s^0 \rightarrow J/\psi K^+ K^-$ in the region $m(KK) > 1.05 \text{ GeV}$.

² Measured using the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi \phi$ decays.

³ Measured using time-dependent angular analysis of $B_s^0 \rightarrow \psi(2S) \phi$ decays.

⁴ Measured using time-dependent angular analysis of $B_s^0 \rightarrow J/\psi K^+ K^-$ decays.

⁵ The error includes both statistical and systematic uncertainties.

⁶ AAIJ 13AR result comes from a combined fit to $B_s^0 \rightarrow J/\psi K^+ K^-$ and $B_s^0 \rightarrow J/\psi \pi^+ \pi^-$ data sets. Also reports $\Delta\Gamma_s = 0.100 \pm 0.016 \pm 0.003 \text{ ps}^{-1}$ from a fit to $B_s^0 \rightarrow J/\psi K^+ K^-$ decays.

⁷ Uses the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi \phi$ decays and assuming CP -violating angle $\beta_s(B^0 \rightarrow J/\psi \phi) = 0.02$.

- ⁸ Measured the angular and lifetime parameters for the time-dependent angular untagged decays $B_d^0 \rightarrow J/\psi K^{*0}$ and $B_s^0 \rightarrow J/\psi \phi$.
⁹ Measured using the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi \phi$ decays and assuming CP -violating phase $\phi_s = 0$.
¹⁰ Obtains 90% CL interval $-0.06 < \Delta\Gamma_s < 0.30$.
¹¹ ABAZOV 07 reports $0.17 \pm 0.09 \pm 0.02$ with CP -violating phase ϕ_s as a free parameter.
¹² Combines D^0 measurements of time-dependent angular distributions in $B_s^0 \rightarrow J/\psi \phi$ and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

$\Delta\Gamma_{B_s^0}/\Gamma_{B_s^0}$

$\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ are the decay rate average and difference between two B_s^0 CP eigenstates (light – heavy).

”OUR EVALUATION” is provided by the Heavy Flavor Averaging Group (HFLAV). It is derived from the averages of $\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ (and their correlation).

- ¹ Measured using $B_s^0 \rightarrow J/\psi\pi^+\pi^-$ decays with $0.9240 < m(\pi\pi) < 1.0204$ GeV, which is dominated by the $f_0(980)$ resonance, making it a CP -odd state.
² Measured using $B_s \rightarrow \mu^+\mu^-$ decays which, in the Standard Model, correspond to B_{sH}^0 decays. Assumes $-2 \operatorname{Re}(\lambda)/(1+|\lambda|^2) = 1$.
³ Measured using $J/\psi\pi^+\pi^-$ mode with $0.880 < m(\pi\pi) < 1.080$ GeV/ c^2 , which is mostly $J/\psi f(0)(980)$ mode, a pure CP -odd final state.
⁴ Measured using a pure CP -odd final state $J/\psi K_S^0$ with the assumption that contributions from penguin diagrams are small.
⁵ Measured using $B_s \rightarrow J/\psi\pi^+\pi^-$ decays which, in the limit of $\phi_s = 0$ and $|\lambda| = 1$, correspond to B_{sH}^0 decays.
⁶ Measured using a pure CP -odd final state $J/\psi f_0(980)$.
⁷ Uses the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi\phi$ decays assuming CP -violating angle $\beta_s(B^0 \rightarrow J/\psi\phi) = 0.02$.

⁸ Obtained from $\Delta\Gamma_s$ and Γ_s fit with a correlation of 0.6.

⁹ Measured using the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi\phi$ decays.

B_{sL}^0 MEAN LIFE

B_{sL}^0 is the light mass state of two B_s^0 CP eigenstates.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV). It is derived from the averages of $\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ (and their correlation).

1.27 ± 0.33 ± 0.08	⁸ BARATE	00K ALEP	$e^+e^- \rightarrow Z$

¹ Measured using results in SIRUNYAN 18BY for the heavy B_s^0 lifetime obtained from $B_s^0 \rightarrow J/\psi\pi^+\pi^-$ decays and the average effective $B_s^0 \rightarrow J/\psi\phi$ lifetime, and magnitude squared of the CP -odd amplitude $|A_{\perp}|^2 = 0.250 \pm 0.006$. The uncertainty includes all statistical and systematic contributions.

² Measured using $B_s^0 \rightarrow J/\psi\eta$ decays.

³ Measured using $B_s^0 \rightarrow D_s^- D_s^+$. The effective lifetime is translated into a decay width of $\Gamma_L = 0.725 \pm 0.014 \pm 0.009$ ps⁻¹.

⁴ Measured using $B_s^0 \rightarrow K^+ K^-$ decays. There may still be CPV in the decay.

⁵ Uses the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi\phi$ decays and assuming CP -violating angle $\beta_s(B^0 \rightarrow J/\psi\phi) = 0.02$.

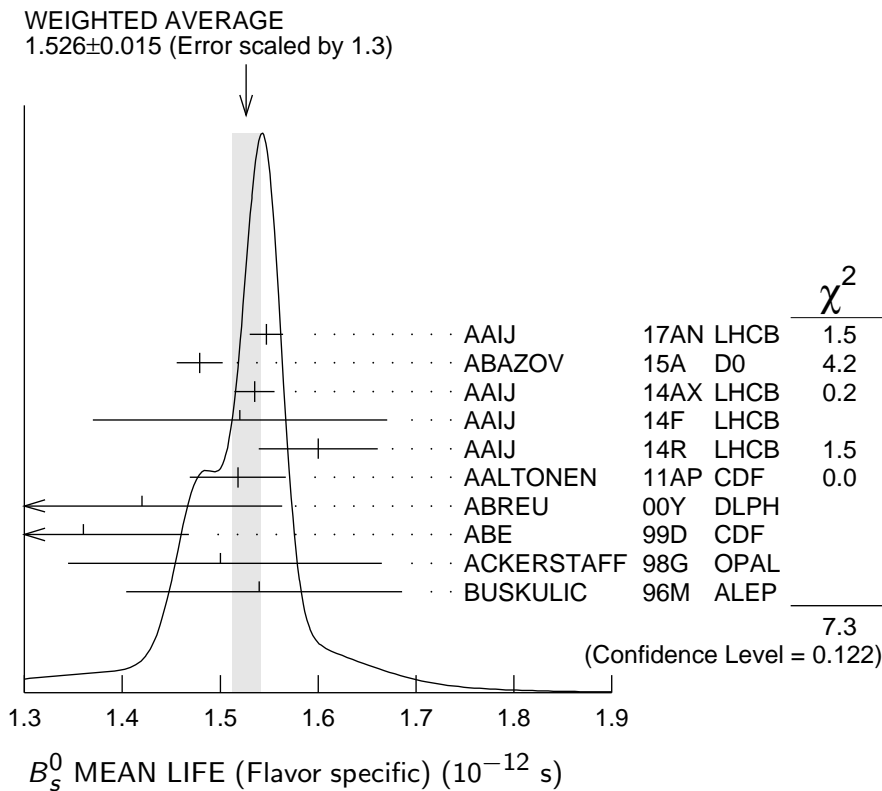

⁶ Obtained from $\Delta\Gamma_s$ and Γ_s fit with a correlation of 0.6.

⁷ Measured using the time-dependent angular analysis of $B_s^0 \rightarrow J/\psi\phi$ decays.

⁸ Uses $\phi\phi$ correlations from $B_s^0 \rightarrow D_s^{(*)+} D_s^{(*)-}$.

VALUE	DOCUMENT ID	TECN	COMMENT
0.980 ± 0.006 ± 0.003	¹ SIRUNYAN	18BY CMS	pp at 8 TeV

¹ Measured using $B_S^0 \rightarrow J/\psi\phi(1020)$ and $B^0 \rightarrow J/\psi K^*(892)^0$ decays.

B_S^0 DECAY MODES

These branching fractions all scale with $B(\bar{b} \rightarrow B_S^0)$.

The branching fraction $B(B_S^0 \rightarrow D_S^- \ell^+ \nu_\ell \text{ anything})$ is not a pure measurement since the measured product branching fraction $B(\bar{b} \rightarrow B_S^0) \times B(B_S^0 \rightarrow D_S^- \ell^+ \nu_\ell \text{ anything})$ was used to determine $B(\bar{b} \rightarrow B_S^0)$, as described in the note on “ B^0 - \bar{B}^0 Mixing”

For inclusive branching fractions, *e.g.*, $B \rightarrow D^\pm \text{ anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level
Γ_1 D_s^- anything	(93 \pm 25) %

[a] Not a pure measurement. See note at head of B_s^0 Decay Modes.

[b] Here S and P are the hypothetical scalar and pseudoscalar particles with masses of $2.5 \text{ GeV}/c^2$ and $214.3 \text{ MeV}/c^2$, respectively.

[c] The value is for the sum of the charge states or particle/antiparticle states indicated.

CONSTRAINED FIT INFORMATION

An overall fit to 12 branching ratios uses 20 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 26.6$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
0.93 ± 0.25 OUR AVERAGE				
0.91 ± 0.18 ± 0.41		¹ DRUTSKOY 07	BELL	$e^+ e^- \rightarrow \Upsilon(4S)$
0.81 ± 0.24 ± 0.22	90	² BUSKULIC 96E	ALEP	$e^+ e^- \rightarrow Z$
1.56 ± 0.58 ± 0.44	147	³ ACTON 92N	OPAL	$e^+ e^- \rightarrow Z$

¹ The extraction of this result takes into account the correlation between the measurements of $B(\Upsilon(5S) \rightarrow D_S X)$ and $B(\Upsilon(5S) \rightarrow D^0 X)$.

² BUSKULIC 96E separate $c\bar{c}$ and $b\bar{b}$ sources of D_S^+ mesons using a lifetime tag, subtract generic $\bar{b} \rightarrow W^+ \rightarrow D_S^+$ events, and obtain $B(\bar{b} \rightarrow B_S^0) \times B(B_S^0 \rightarrow D_S^- \text{ anything}) = 0.088 \pm 0.020 \pm 0.020$ assuming $B(D_S \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$ and PDG 1994 values for the relative partial widths to other D_S channels. We evaluate using our current values $B(\bar{b} \rightarrow B_S^0) = 0.107 \pm 0.014$ and $B(D_S \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_S^0)$ and $B(D_S \rightarrow \phi\pi)$.

³ ACTON 92N assume that excess of $147 \pm 48 D_S^0$ events over that expected from B^0 , B^+ , and $c\bar{c}$ is all from B_S^0 decay. The product branching fraction is measured to be $B(\bar{b} \rightarrow B_S^0) B(B_S^0 \rightarrow D_S^- \text{ anything}) \times B(D_S^- \rightarrow \phi\pi^-) = (5.9 \pm 1.9 \pm 1.1) \times 10^{-3}$. We evaluate using our current values $B(\bar{b} \rightarrow B_S^0) = 0.107 \pm 0.014$ and $B(D_S \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_S^0)$ and $B(D_S \rightarrow \phi\pi)$.

¹ The measurement corresponds to the average of the electron and muon branching fractions.

² The measurement corresponds to a branching fraction where the lepton originates from bottom decay and is the average between the electron and muon branching fractions. LEES 12A uses the correlation of the production of ϕ mesons in association with a lepton in e^+e^- data taken at center-of-mass energies between 10.54 and 11.2 GeV.

The values and averages in this section serve only to show what values result if one assumes our $B(\bar{b} \rightarrow B_s^0)$. They cannot be thought of as measurements since the underlying product branching fractions were also used to determine $B(\bar{b} \rightarrow B_s^0)$ as described in the note on "Production and Decay of b -Flavored Hadrons."

7.6±1.2±2.1	134	² BUSKULIC	950	ALEP $e^+e^- \rightarrow Z$
10.7±4.3±2.9		³ ABREU	92M	DLPH $e^+e^- \rightarrow Z$
10.3±3.6±2.8	18	⁴ ACTON	92N	OPAL $e^+e^- \rightarrow Z$
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●				
13 ±4 ±4	27	⁵ BUSKULIC	92E	ALEP $e^+e^- \rightarrow Z$

¹ Obtains $B_s \rightarrow D_s X e \nu$, and $D_s X \mu \nu$ separately, then combines them by assuming systematic uncertainties are fully correlated, except for the one on lepton identification. The third uncertainty adds in quadrature systematic uncertainties from external sources (number of B_s events, and $D_s^{(*)}$ branching fractions). OSWALD 15 also measures the cross-section $\sigma(e^+e^- \rightarrow B_s^{(*)} \bar{B}_s^{(*)}) = 53.8 \pm 1.4 \pm 5.3$ pb at $\sqrt{s} = 10.86$ GeV.

² BUSKULIC 950 use $D_s \ell$ correlations. The measured product branching ratio is $B(\bar{b} \rightarrow B_s) \times B(B_s \rightarrow D_s^- \ell^+ \nu_\ell \text{anything}) = (0.82 \pm 0.09_{-0.14}^{+0.13})\%$ assuming $B(D_s \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$ and PDG 1994 values for the relative partial widths to the six other D_s channels used in this analysis. Combined with results from $\mathcal{T}(4S)$ experiments this can be used to extract $B(\bar{b} \rightarrow B_s) = (11.0 \pm 1.2_{-2.6}^{+2.5})\%$. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$.

³ ABREU 92M measured muons only and obtained product branching ratio $B(Z \rightarrow b \text{ or } \bar{b}) \times B(\bar{b} \rightarrow B_s) \times B(B_s \rightarrow D_s \mu^+ \nu_\mu \text{ anything}) \times B(D_s \rightarrow \phi\pi) = (18 \pm 8) \times 10^{-5}$.

We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$. We use $B(Z \rightarrow b \text{ or } \bar{b}) = 2B(Z \rightarrow b\bar{b}) = 2 \times (0.2212 \pm 0.0019)$.

⁴ ACTON 92N is measured using $D_s \rightarrow \phi\pi^+$ and $K^*(892)^0 K^+$ events. The product branching fraction measured is measured to be $B(\bar{b} \rightarrow B_s^0)B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) \times B(D_s^- \rightarrow \phi\pi^-) = (3.9 \pm 1.1 \pm 0.8) \times 10^{-4}$. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$.

⁵ BUSKULIC 92E is measured using $D_s \rightarrow \phi\pi^+$ and $K^*(892)^0 K^+$ events. They use $2.7 \pm 0.7\%$ for the $\phi\pi^+$ branching fraction. The average product branching fraction is measured to be $B(\bar{b} \rightarrow B_s^0)B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) = 0.020 \pm 0.0055^{+0.005}_{-0.006}$. We evaluate using our current values $B(\bar{b} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{b} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$. Superseded by BUSKULIC 950.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at <http://www.slac.stanford.edu/xorg/hflav/>. The averaging/rescaling procedure takes into account correlations between the measurements.

¹ AAIJ 16P reports $[\Gamma(B_s^0 \rightarrow D_s^{(*)+} D_s^{(*)-})/\Gamma_{\text{total}}] / [B(B^0 \rightarrow D^- D_s^+)] = 4.24 \pm 0.14 \pm 0.27$ which we multiply by our best value $B(B^0 \rightarrow D^- D_s^+) = (7.2 \pm 0.8) \times 10^{-3}$.				

Our first error is their experiment's error and our second error is the systematic error from using our best value.

² Use $\Upsilon(5S) \rightarrow B_S^* \bar{B}_S^*$ decays assuming $B(\Upsilon(5S) \rightarrow B_S^* \bar{B}_S^*) = (17.1 \pm 3.0)\%$ and

$$\Gamma(\Upsilon(5S) \rightarrow B_S^* \bar{B}_S^*) / \Gamma(\Upsilon(5S) \rightarrow B_S^{(*)} \bar{B}_S^{(*)}) = (87.0 \pm 1.7)\%.$$

³ AALTONEN 12C reports $(f_S/f_D) (B(B_S^0 \rightarrow D_S^{(*)+} D_S^{(*)-}) / B(B^0 \rightarrow D^- D_S^+)) = 1.261 \pm 0.095 \pm 0.112$. We multiply this result by our best value of $B(B^0 \rightarrow D^- D_S^+)$

$$= (7.2 \pm 0.8) \times 10^{-3} \text{ and divide by our best value of } f_S/f_D, \text{ where } 1/2 f_S/f_D = 0.1275 \pm 0.0065. \text{ Our first quoted uncertainty is the combined experiment's uncertainty and our second is the systematic uncertainty from using our best values.}$$

⁴ Uses the final states where $D_S^+ \rightarrow \phi \pi^+$ and $D_S^- \rightarrow \phi \mu^- \bar{\nu}_\mu$.

⁵ Reports $B(B_S^0(\text{short}) \rightarrow D_S^{(*)} D_S^{(*)}) = (0.23 \pm 0.10 \pm 0.05) \cdot [0.17/B(D_S \rightarrow \phi \chi)]^2$ assuming $B(B_S^0 \rightarrow B_S^0(\text{short})) = 50\%$. We use our best value of $B(D_S \rightarrow \phi \chi) = 15.7 \pm 1.0\%$ to obtain the quoted result.

⁶ Uses $\phi\phi$ correlations from $B_S^0(\text{short}) \rightarrow D_S^{(*)+} D_S^{(*)-}$.

⁷ Sum of exclusive $B_S \rightarrow D_S^+ D_S^-$, $B_S \rightarrow D_S^{*\pm} D_S^{\mp}$ and $B_S \rightarrow D_S^{*+} D_S^{*-}$.

⁸ Uses $\Upsilon(10860) \rightarrow B_S^* \bar{B}_S^*$ assuming $B(\Upsilon(10860) \rightarrow B_S^{(*)} \bar{B}_S^{(*)}) = (19.3 \pm 2.9)\%$ and

$$\Gamma(\Upsilon(10860) \rightarrow B_S^* \bar{B}_S^*) / \Gamma(\Upsilon(10860) \rightarrow B_S^{(*)} \bar{B}_S^{(*)}) = (90.1^{+3.8}_{-4.0})\%.$$

$8.4 \pm 1.6 \pm 0.3$	¹ AAIJ	15S LHCb	pp at 7, 8 TeV

¹ AAIJ 15S reports $(8.6 \pm 1.5 \pm 0.7 \pm 0.7) \times 10^{-8}$ from a measurement of $[\Gamma(B_s^0 \rightarrow \pi^+\pi^-\mu^+\mu^-)/\Gamma_{\text{total}}] / [B(B^0 \rightarrow J/\psi(1S)K^*(892)^0)]$ assuming $B(B^0 \rightarrow J/\psi(1S)K^*(892)^0) = (1.3 \pm 0.1) \times 10^{-3}$, which we rescale to our best value $B(B^0 \rightarrow J/\psi(1S)K^*(892)^0) = (1.27 \pm 0.05) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

$\Gamma(\phi\nu\bar{\nu})/\Gamma_{\text{total}}$ Γ_{134}/Γ

$< 4.1 \times 10^{-5}$	90	³ ACCIARRI	97B L3	$e^+e^- \rightarrow Z$

¹ AAIJ 18T uses normalization modes $B(B^0 \rightarrow K^+\pi^-) = (19.6 \pm 0.5) \times 10^{-6}$ and $B(B^+ \rightarrow J/\psi K^+) = (1.026 \pm 0.031) \times 10^{-3}$ with B production ratio $f(\bar{b} \rightarrow B_s^0)/f(\bar{b} \rightarrow B_d^0) = 0.259 \pm 0.015$. The upper limit increases to 6×10^{-9} with the assumption of B_L -dominated decay amplitude.

² Uses normalization mode $B(B^0 \rightarrow K^+\pi^-) = (19.4 \pm 0.6) \times 10^{-6}$ and B production ratio $f(\bar{b} \rightarrow B_s^0)/f(\bar{b} \rightarrow B_d^0) = 0.256 \pm 0.020$.

³ ACCIARRI 97B assume PDG 96 production fractions for B^+ , B^0 , B_s , and Λ_b .

POLARIZATION IN B_s^0 DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L), or both are transverse and parallel (\parallel), or perpendicular (\perp) to each other with the parameters Γ_L/Γ , Γ_\perp/Γ , and the relative phases ϕ_\parallel and ϕ_\perp . In decays involving two tensor mesons, the transverse polarization states are described by parameters $\Gamma_{\parallel 1}$, $\Gamma_{\parallel 2}$, $\Gamma_{\perp 1}$, $\Gamma_{\perp 2}$ and their relative phases $\phi_{\parallel 1}$, $\phi_{\parallel 2}$, $\phi_{\perp 1}$, $\phi_{\perp 2}$. See also the review on "Polarization in B Decays."

$B_s^0-\bar{B}_s^0$ MIXING

For a discussion of $B_s^0-\bar{B}_s^0$ mixing see the note on “ $B^0-\bar{B}^0$ Mixing” in the B^0 Particle Listings above.

χ_s is a measure of the time-integrated $B_s^0-\bar{B}_s^0$ mixing probability that produced $B_s^0(\bar{B}_s^0)$ decays as a $\bar{B}_s^0(B_s^0)$. Mixing violates $\Delta B \neq 2$ rule.

$$\chi_s = \frac{x_s^2}{2(1+x_s^2)}$$

$$x_s = \frac{\Delta m_{B_s^0}}{\Gamma_{B_s^0}} = (m_{B_{sH}^0} - m_{B_{sL}^0}) \tau_{B_s^0},$$

where H, L stand for heavy and light states of two B_s^0 CP eigenstates and

$$\tau_{B_s^0} = \frac{1}{0.5(\Gamma_{B_{sH}^0} + \Gamma_{B_{sL}^0})}.$$

$$\Delta m_{B_s^0} = m_{B_{sH}^0} - m_{B_{sL}^0}$$

$\Delta m_{B_s^0}$ is a measure of 2π times the $B_s^0-\bar{B}_s^0$ oscillation frequency in time-dependent mixing experiments.

“OUR EVALUATION” is provided by the Heavy Flavor Averaging Group (HFLAV) by taking into account correlations between measurements.

¹ Measured using time-dependent angular analysis of $B_s^0 \rightarrow J/\psi K^+ K^-$ decays.

² Measured using $B_s^0 \rightarrow D_s^- \pi^+$ decays.

³ Measured using $B_s^0 \rightarrow D_s^- \mu^+ \nu_\mu X$ decays.

⁴ Measured using $B_s^0 \rightarrow D_s^- \pi^+$ and $D_s^- \pi^+ \pi^- \pi^+$ decays.

⁵ Significance of oscillation signal is 5.4σ . Also reports $|V_{td} / V_{ts}| = 0.2060 \pm 0.0007^{+0.0081}_{-0.0060}$.

- ⁶ A likelihood scan over the oscillation frequency, Δm_s , gives a most probable value of 19 ps^{-1} and a range of $17 < \Delta m_s < 21 \text{ (ps}^{-1})$ at 90% C.L. assuming Gaussian uncertainties. Also excludes $\Delta m_s < 14.8 \text{ ps}^{-1}$ at 95% C.L.
- ⁷ Significance of oscillation signal is 0.2%. Also reported the value $|V_{td} / V_{ts}| = 0.208^{+0.001+0.008}_{-0.002-0.006}$.
- ⁸ Uses leptons emitted with large momentum transverse to a jet and improved techniques for vertexing and flavor-tagging.
- ⁹ Updates of D_s -lepton analysis.
- ¹⁰ Combined results from all Delphi analyses.
- ¹¹ Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.
- ¹² ABE 03 uses the novel “charge dipole” technique to reconstruct separate secondary and tertiary vertices originating from the $B \rightarrow D$ decay chain. The analysis excludes $\Delta m_s < 4.9 \text{ ps}^{-1}$ and $7.9 < \Delta m_s < 10.3 \text{ ps}^{-1}$.
- ¹³ Three analyses based on complementary event selections: (1) fully-reconstructed hadronic decays; (2) semileptonic decays with D_s exclusively reconstructed; (3) inclusive semileptonic decays.
- ¹⁴ ABE 02V uses exclusively reconstructed D_s^- mesons and excludes $\Delta m_s < 1.4 \text{ ps}^{-1}$ and $2.4 < \Delta m_s < 5.3 \text{ ps}^{-1}$ at 95%CL.
- ¹⁵ Uses fully or partially reconstructed $D_s \ell$ vertices and a mixing tag as a flavor tagging.
- ¹⁶ Replaced by ABDALLAH 04A. Uses $D_s^- \ell^+$, and $\phi \ell^+$ vertices, and a multi-variable discriminant as a flavor tagging.
- ¹⁷ Uses inclusive D_s vertices and fully reconstructed B_s decays and a multi-variable discriminant as a flavor tagging.
- ¹⁸ Uses ℓ - Q_{hem} and ℓ - ℓ .
- ¹⁹ ABE 99D assumes $\tau_{B_s^0} = 1.55 \pm 0.05 \text{ ps}$ and $\Delta\Gamma/\Delta m = (5.6 \pm 2.6) \times 10^{-3}$.
- ²⁰ ABE 99J uses ϕ ℓ - ℓ correlation.
- ²¹ BARATE 99J uses combination of an inclusive lepton and D_s^- -based analyses.
- ²² BARATE 98C combines results from $D_s h$ - ℓ/Q_{hem} , $D_s h$ - K in the same side, $D_s \ell$ - ℓ/Q_{hem} and $D_s \ell$ - K in the same side.
- ²³ Uses ℓ - Q_{hem} .
- ²⁴ Uses ℓ - ℓ .
- ²⁵ ADAM 97 combines results from $D_s \ell$ - Q_{hem} , ℓ - Q_{hem} , and ℓ - ℓ .
- ²⁶ BUSKULIC 96M uses D_s lepton correlations and lepton, kaon, and jet charge tags.
- ²⁷ BUSKULIC 95J uses ℓ - Q_{hem} . They find $\Delta m_s > 5.6$ [> 6.1] for $f_s=10\%$ [12%]. We interpolate to our central value $f_s=10.5\%$.

$$x_s = \Delta m_{B_s^0} / \Gamma_{B_s^0}$$

This is derived by the Heavy Flavor Averaging Group (HFLAV) from the results on $\Delta m_{B_s^0}$ and “OUR EVALUATION” of the B_s^0 mean lifetime.

¹ AAIJ 16G reports a measurement of time-integrated flavor-specific asymmetry in $B_s^0 \rightarrow \mu^+ D_s^- X$ decays, $A_{SL}^s = (0.39 \pm 0.26 \pm 0.20)\%$, which is approximately equal to $4 \times \text{Re}(\epsilon_{B_s^0}) / (1 + |\epsilon_{B_s^0}|^2)$.

² ABAZOV 14 uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^s = (-0.86 \pm 0.74) \times 10^{-2}$.

³ ABAZOV 13 reports a measurement of time-integrated flavor-specific asymmetry in mixed semileptonic $B_s^0 \rightarrow \mu^+ D_s^- X$ decays $A_{SL}^s = (-1.12 \pm 0.74 \pm 0.17)\%$ which is approximately equal to $4 \times \text{Re}(\epsilon_{B_s^0}) / (1 + |\epsilon_{B_s^0}|^2)$.

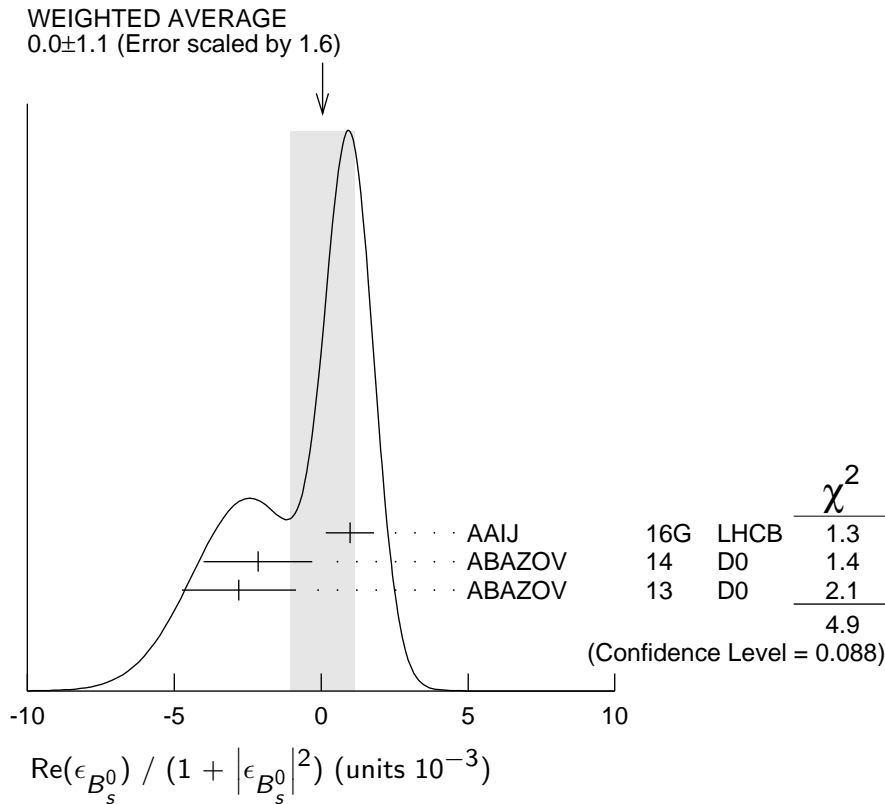

⁴ AAIJ 14D reports a measurement of time-integrated flavor-specific asymmetry in $B_s^0 \rightarrow \mu^+ D_s^- X$ decays, $A_{SL}^s = (-0.06 \pm 0.50 \pm 0.36)\%$, which is approximately equal to $4 \times \text{Re}(\epsilon_{B_s^0}) / (1 + |\epsilon_{B_s^0}|^2)$.

⁵ ABAZOV 11U uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^s = (-18.1 \pm 10.6) \times 10^{-3}$.

⁶ ABAZOV 10E reports a measurement of flavor-specific asymmetry in $B_{(s)}^0 \rightarrow \mu^+ D_{(s)}^{*-} X$ decays with a decay-time analysis including initial-state flavor tagging, $A_{SL}^s = (-1.7 \pm 9.1_{-1.5}^{+1.4}) \times 10^{-3}$ which is approximately equal to $4 \times \text{Re}(\epsilon_{B_s^0}) / (1 + |\epsilon_{B_s^0}|^2)$.

⁷ ABAZOV 10H reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^s = (-9.57 \pm 2.51 \pm 1.46) \times 10^{-3}$ in semileptonic b -hadron decays. Using the measured production ratio of B_d^0 and B_s^0 , and the asymmetry of B_d^0 $A_{SL}^s = (-4.7 \pm 4.6) \times 10^{-3}$ measured from B -factories, they obtain the asymmetry for B_s^0 .

⁸The first direct measurement of the time integrated flavor untagged charge asymmetry in semileptonic B_s^0 decays is reported as $2 \times A_{SL}^s(\text{untagged}) = A_{SL}^s = (2.45 \pm 1.93 \pm 0.35) \times 10^{-2}$.

CP Violation phase β_s

$-2\beta_s$ is the weak phase difference between B_s^0 mixing amplitude and the $B_s^0 \rightarrow J/\psi\phi$ decay amplitude driven by the $b \rightarrow c\bar{c}s$ transition (such as $B_s \rightarrow J/\psi\phi$, $J/\psi K^+ K^-$, $J/\psi\pi^+\pi^-$, and $D_s^+ D_s^-$). The Standard Model value of β_s is $\arg(-\frac{V_{ts}V_{tb}^*}{V_{cs}V_{cb}^*})$ if penguin contributions are neglected.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <http://www.slac.stanford.edu/xorg/hflav/>. The averaging/scaling procedure takes into account correlation between the measurements.

¹ Measured using time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ in the region $m(KK) > 1.05$ GeV.

² AAD 16AP reports $\phi_S = -2\beta_S = -0.090 \pm 0.078 \pm 0.041$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

³ AAIJ 16AK reports $\phi_S = -2\beta_S = 0.23_{-0.28}^{+0.29} \pm 0.02$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow \psi(2S)\phi$ decays.

⁴ KHACHATRYAN 16S reports $\phi_S = -2\beta_S = -0.075 \pm 0.097 \pm 0.031$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

⁵ AAIJ 15I reports $\phi_S = -2\beta_S = -0.058 \pm 0.049 \pm 0.006$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ decays. It also combines this result with that of AAIJ 14S and quotes $\phi_S = -2\beta_S = -0.010 \pm 0.039$ rad.

⁶ AAIJ 14AY reports $\phi_S = -2\beta_S = 0.02 \pm 0.17 \pm 0.02$ rad. in a time-dependent fit to $B_S^0 \rightarrow D_S^+ D_S^-$, while allowing CP violation in decay.

⁷ AAIJ 14S reports $\phi_S = -2\beta_S = 0.070 \pm 0.068 \pm 0.008$ rad. and $|\lambda| = 0.89 \pm 0.05 \pm 0.01$, when direct CP violation is allowed. Measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays.

⁸ AALTONEN 12AJ reports $-\pi/2 < \beta_S < -1.51$ or $-0.06 < \beta_S < 0.30$, or $1.26 < \beta_S < \pi/2$ rad. at 68% CL. Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

⁹ ABAZOV 12D reports $\phi_S = -2\beta_S = -0.55_{-0.36}^{+0.38}$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays. A single error includes both statistical and systematic uncertainties.

¹⁰ AAIJ 18S reports $\phi_S = -2\beta_S = -0.10 \pm 0.13 \pm 0.14$ rad measured in $B_S^0 \rightarrow (K^+\pi^-)(K^-\pi^+)$ in the region $0.75 < m(K^\pm\pi^\mp) < 1.6$ GeV. This is a $b \rightarrow d\bar{d}s$ transition with a decay amplitude phase different from that of $b \rightarrow c\bar{c}s$ transition.

¹¹ AAIJ 15K reports $-2\beta_S = -0.12_{-0.16}^{+0.14}$ rad. The value was obtained by measuring time-dependent CP asymmetry in $B_S^0 \rightarrow K^+K^-$ and using a U-spin relation between $B_S^0 \rightarrow K^+K^-$ and $B^0 \rightarrow \pi^+\pi^-$.

¹² Results are also presented using additional inputs on $B^0 \rightarrow \pi^0\pi^0$ and $B^+ \rightarrow \pi^+\pi^0$ decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.

¹³ AAD 14U reports $\phi_S = -2\beta_S = 0.12 \pm 0.25 \pm 0.05$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

¹⁴ Measured in $B_S^0 \rightarrow \phi\phi$ decays. This is a $b \rightarrow s\bar{s}s$ transition with a decay amplitude phase different from that of $b \rightarrow c\bar{c}s$ transition.

¹⁵ AAIJ 13AR reports $\phi_S = -2\beta_S = 0.01 \pm 0.07 \pm 0.01$ rad. obtained from combined fit to $B_S^0 \rightarrow J/\psi K^+ K^-$ and $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ data sets. Also reports separate results of $\phi_S = 0.07 \pm 0.09 \pm 0.01$ rad. from $B_S^0 \rightarrow J/\psi K^+ K^-$ decays and $\phi_S = -0.14_{-0.16}^{+0.17} \pm 0.01$ rad. from $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays.

- ¹⁶ AAIJ 13AY uses $B_S^0 \rightarrow \phi\phi$ mode, and reports the 68% CL interval of $\phi_S = -2\beta_S$ as $[-2.46, -0.76]$ rad.
- ¹⁷ AAD 12CV reports $\phi_S = -2\beta_S = 0.22 \pm 0.41 \pm 0.10$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.
- ¹⁸ Reports $\phi_S = -2\beta_S = -0.44 \pm 0.44 \pm 0.02$ rad. that was measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi f_0(980)$ decays.
- ¹⁹ Reports $\phi_S = -2\beta_S = 0.15 \pm 0.18 \pm 0.06$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.
- ²⁰ Reports $\phi_S = -2\beta_S = -0.019^{+0.173+0.004}_{-0.174-0.003}$ rad. which was measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays, with the $\pi^+\pi^-$ mass within 775–1550 MeV. Searches for, but finds no evidence, for direct CP violation in $B_S^0 \rightarrow J/\psi\pi\pi$ decays.
- ²¹ Reports $0.02 < \phi_S < 0.52$ or $1.08 < \phi_S < 1.55$ rad. at 68% C.L. confidence regions in the two-dimensional space of ϕ_S and $\Delta\Gamma_{B_S^0}$ from $B_S^0 \rightarrow J/\psi\phi$ decays.
- ²² Reports $0.32 < 2\beta_S < 2.82$ rad. at 68% C.L. and confidence regions in the two-dimensional space of $2\beta_S$ and $\Delta\Gamma$ from the first measurement of $B_S^0 \rightarrow J/\psi\phi$ decays using flavor tagging. The probability of a deviation from SM prediction as large as the level of observed data is 15%.
- ²³ Reports $\phi_S = -2\beta_S$ and obtains 90% CL interval $-0.03 < \beta_S < 0.60$ rad.
- ²⁴ The first direct measurement of the CP -violating mixing phase is reported from the time-dependent analysis of flavor untagged $B_S^0 \rightarrow J/\psi\phi$ decays.
- ²⁵ Reports ϕ_S which equals to $-2\beta_S$.
- ²⁶ Combines D0 collaboration measurements of time-dependent angular distributions in $B_S^0 \rightarrow J/\psi\phi$ and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

$A_{CP}(B_s \rightarrow \pi^+ K^-)$

A_{CP} is defined as

$$\frac{B(\bar{B}_s^0 \rightarrow f) - B(B_s^0 \rightarrow \bar{f})}{B(\bar{B}_s^0 \rightarrow f) + B(B_s^0 \rightarrow \bar{f})},$$

the CP-violation asymmetry of exclusive B_s^0 and \bar{B}_s^0 decay.

$A^\Delta(B_s \rightarrow \phi\gamma)$

$A^\Delta(B_s \rightarrow \phi\gamma)$ is the multiplicative coefficient of the $\sinh(\Delta\Gamma t/2)$ term in the $B_s \rightarrow \phi\gamma$ decay rate time dependence.

VALUE	DOCUMENT ID	TECN	COMMENT
-0.98^{+0.46+0.23}_{-0.52-0.20}	¹ AAIJ	17B LHCb	pp at 7, 8 TeV

¹ Measured in time dependent analysis without initial flavor tagging.

CPT VIOLATION PARAMETERS

In the B_s^0 mixing, propagating mass eigenstates can be written as

$$\begin{aligned} |B_{sL}\rangle &\propto p \sqrt{1-\xi} |B_s^0\rangle + q \sqrt{1+\xi} |\bar{B}_s^0\rangle \\ |B_{sH}\rangle &\propto p \sqrt{1+\xi} |B_s^0\rangle - q \sqrt{1-\xi} |\bar{B}_s^0\rangle \end{aligned}$$

where parameter ξ controls CPT violation. If ξ is zero, then CPT is conserved. The parameter ξ can be written as

$$\xi = \frac{2(M_{11}-M_{22})-i(\Gamma_{11}-\Gamma_{22})}{-2\Delta m_s+i\Delta\Gamma_s} \approx \frac{-2\beta^\mu \Delta a_\mu}{2\Delta m_s-i\Delta\Gamma_s},$$

where M_{ii} , Γ_{ii} , Δm_s , and $\Delta\Gamma_s$ are parameters of Hamiltonian governing B_s oscillations, β^μ is the B_s^0 meson velocity and Δa_μ characterizes Lorentz-invariance violation.
