

**$\Sigma(1775)$**  $I(J^P) = 1(\frac{5}{2}^-)$  Status: \*\*\*

Discovered by GALTIERI 63, this resonance plays the same role as cornerstone for isospin-1 analyses in this region as the  $\Lambda(1820)F_{05}$  does in the isospin-0 channel.

For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

$\Gamma_{14} N\bar{K}^*(892)$ , $S=3/2$ , <i>G</i> -wave	

## CONSTRAINED FIT INFORMATION

An overall fit to 7 branching ratios uses 18 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 363.4$  for 14 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$$\begin{array}{c|cccc} & x_2 & -44 & & \\ x_2 & & -23 & 10 & \\ & x_3 & -23 & -32 & -4 \\ & x_4 & -3 & 1 & 1 & -84 \\ x_8 & & & & \\ \hline & x_1 & x_2 & x_3 & x_4 \end{array}$$

## $\Sigma(1775)$ BRANCHING RATIOS

See “Sign conventions for resonance couplings” in the Note on  $\Lambda$  and  $\Sigma$  Resonances. Also, the errors quoted do not include uncertainties due to

the parametrization used in the partial-wave analyses and are thus too small.
