- AABOUD 19AC is an ATLAS combination of 7 and 8 TeV top-quark mass determination in the dilepton, lepton + jets, and all jets channels.
- SIRUNYAN 19AP based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. A combined measurement using the lepton+jets and all-jets channels through a single likelihood function. See SIRUNYAN 18DE and SIRUNYAN 19AP below.
- SIRUNYAN 19AR based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Obtained from a simultaneous fit of the cross section and the top quark mass in the POWHEG simulation. The cross section is used also to extract the MS mass and the strong coupling constant for different PDF sets.
- SIRUNYAN 17L based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. m_t is reconstructed from a fit to the invariant mass distribution of $\mu\nu b$, where p_T^{miss} and W mass constraint are used to reconstruct ν momentum. The number of events for various contributions, except for the t -channel single top one, are fixed to the values extracted from simulation.
- KHACHATRYAN 16AK based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Combination of the three top mass measurements in KHACHATRYAN 16AK and with the CMS results at $\sqrt{s} = 7$ TeV.
- TEVEVWG 16 is the latest Tevatron average (July 2016) provided by the Tevatron Electroweak Working Group. It takes correlated uncertainties into account and has a χ^2 of 10.8 for 11 degrees of freedom.
- AABOUD 19AC based on 20.2 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV. Uses optimized event selection to suppress less-well-reconstructed events and template fits to determine m_t together with a global jet energy scale factor and a relative b -to-light-jet energy scale factor.
- SIRUNYAN 19AP based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. A kinematical fit is applied to each event assuming the signal event topology. m_t is determined simultaneously with a jet energy scale factor (JSF). The second error represents stat.+JSF. Modeling uncertainties are larger than in the measurements at $\sqrt{s} = 7$ and 8 TeV because of the use of new alternative color reconnection models.
- SIRUNYAN 18DE based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. m_t is determined simultaneously with an overall jet energy scale factor constrained by the mass of the hadronically decayed W . Compared to the Run 1 analysis a more advanced treatment of modeling uncertainties are employed, in particular concerning color-reconnection models.
- AABOUD 17AH based on 20.2 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Uses template fits to the ratio of the masses of three-jets (from t candidate) and dijets (from W candidate), to suppress jet energy scale uncertainty. Large QCD background is modelled using a data-driven method.
- ABAZOV 17B is a combination of measurements of the top quark mass by D0 in the lepton+jets and dilepton channels, using all data collected in Run I (1992–1996) at $\sqrt{s} = 1.8$ TeV and Run II (2001–2011) at $\sqrt{s} = 1.96$ TeV of the Tevatron, corresponding to integrated luminosities of 0.1 fb⁻¹ and 9.7 fb⁻¹, respectively.
- SIRUNYAN 17N based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The fully hadronic decay of a highly-boosted t is reconstructed in the $\ell +$ jets channel and unfolded at the particle level. The sensitivity of the peak position of the m_{jet} distribution is used to test quality of the modelling by the simulation.
- SIRUNYAN 17O based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Analysis is based on the kinematical observables $M(b\ell)$, M_{T2} and $M(b\ell\nu)$. A fit is performed to determine m_t and an overall jet energy scale factor simultaneously.
- AABOUD 16T based on 20.2 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The analysis is refined using the p_T and invariant mass distributions of $\ell + b$ -jet system. A combination with measurements from $\sqrt{s} = 7$ TeV data in the dilepton and lepton+jets channels gives $172.84 \pm 0.34 \pm 0.61$ GeV.
- AABOUD 16T is an ATLAS combination of 8 TeV top-quark mass in the dilepton channel with previous measurements from $\sqrt{s} = 7$ TeV data in the dilepton and lepton + jets channels.
- ABAZOV 16 based on 9.7 fb⁻¹ of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. Employs improved fit to minimize statistical errors and improved jet energy calibration, using lepton + jets mode, which reduces error of jet energy scale. Based on previous determination in ABAZOV 12AB with increased integrated luminosity and improved fit and calibrations.
- ABAZOV 16D based on 9.7 fb⁻¹ of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV, using the matrix element technique. Based on previous determination in ABAZOV 11R with increased integrated luminosity. There is a strong correlation with the determination in ABAZOV 16. (See ABAZOV 17B.)
- KHACHATRYAN 16AK based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Combination of the three top mass measurements in KHACHATRYAN 16AK and with the CMS results at $\sqrt{s} = 7$ TeV gives $172.44 \pm 0.13 \pm 0.47$ GeV.
- The top mass and jet energy scale factor are determined by a fit.
- Uses the analytical matrix weighting technique method.
- KHACHATRYAN 16AL based on 19.7 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV. Determined from the invariant mass distribution of leptons and reconstructed secondary vertices from b decays using only charged particles. The uncertainty is dominated by modeling of b fragmentation and top p_T distribution.
- KHACHATRYAN 16CB based on 666 candidate reconstructed events corresponding to 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The measurement exploits correlation of m_t with $M(J/\psi X)$ in the same top quark decay, using a high-purity event sample. A study on modeling of b -quark fragmentation is given in Sec.3.3.
- AAD 15AW based on 4.6 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. Uses template fits to the ratio of the masses of three-jets (from t candidate) and dijets (from W candidate). Large background from multijet production is modeled with data-driven methods.
- AAD 15BF based on 4.6 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV. Using a three-dimensional template likelihood technique the lepton plus jets ($\geq 1b$ -tagged) channel gives $172.33 \pm 0.75 \pm 1.02$ GeV, while exploiting a one dimensional template method using $m_{\ell b}$ the dilepton channel (1 or 2b-tags) gives $173.79 \pm 0.54 \pm 1.30$ GeV. The results are combined.

Quark Particle Listings

t

- 25 AALTONEN 15D based on 9.1 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. Uses a template technique to fit a distribution of a variable defined by a linear combination of variables sensitive and insensitive to jet energy scale to optimize reduction of systematic errors. b -tagged and non- b -tagged events are separately analyzed and combined.
- 26 Based on 9.3 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. Multivariate algorithm is used to discriminate signal from backgrounds, and templates are used to measure m_t .
- 27 Based on 9.7 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. A matrix element method is used to calculate the probability of an event to be signal or background, and the overall jet energy scale is constrained *in situ* by m_W . See ABAZOV 15G for further details.
- 28 Based on 3.54 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. The mass is reconstructed for each event employing a kinematic fit of the jets to a $t\bar{t}$ hypothesis. The combination with the previous CMS measurements in the dilepton and the lepton+jets channels gives $173.54 \pm 0.33 \pm 0.96 \text{ GeV}$.
- 29 Based on 8.7 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Events with an identified charged lepton or small E_T are rejected from the event sample, so that the measurement is statistically independent from those in the $\ell + \text{jets}$ and all hadronic channels while being sensitive to those events with a τ lepton in the final state.
- 30 Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 13s studied events with di-lepton + $E_T + \geq 2$ b -jets, and looked for kinematic endpoints of MT2, MT2 $_T$, and subsystem variables.
- 31 AAD 12i based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. Uses 2d-template analysis (MT) with m_t and jet energy scale factor (JSF) from m_W mass fit.
- 32 Based on 8.7 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV . The JES is calibrated by using the dijet mass from the W boson decay.
- 33 Use the ME method based on 2.2 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV .
- 34 Combination based on up to 5.8 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV .
- 35 Based on 5.8 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV the quoted value is $m_t = 172.5 \pm 1.4(\text{stat}) \pm 1.0(\text{JES}) \pm 1.1(\text{syst}) \text{ GeV}$. The measurement is performed with a likelihood fit technique which simultaneously determines m_t and JES (Jet Energy Scale).
- 36 Based on 4.3 fb^{-1} of data in p - \bar{p} collisions at 1.96 TeV . The measurement reduces the JES uncertainty by using the single lepton channel study of ABAZOV 11P.
- 37 Combination with the result in 1 fb^{-1} of preceding data reported in ABAZOV 09AH as well as the MWT result of ABAZOV 11R with a statistical correlation of 60%.
- 38 Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. Uses an analytical matrix weighting technique (AMWT) and full kinematic analysis (KIN).
- 39 Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. The first error is statistical and JES combined, and the second is systematic. Ideogram method is used to obtain 2D likelihood for the kinematical fit with two parameters m_{top} and JES.
- 40 Based on 3.2 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and JES combined, and the latter is from the other systematic uncertainties. The result is obtained using an unbinned maximum likelihood method where the top quark mass and the JES are measured simultaneously, with $\Delta_{JES} = 0.3 \pm 0.3(\text{stat})$.
- 41 Based on 5.7 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Events with an identified charged lepton or small E_T are rejected from the event sample, so that the measurement is statistically independent from those in the $\ell + \text{jets}$ and all hadronic channels while being sensitive to those events with a τ lepton in the final state. Supersedes AALTONEN 07B.
- 42 AALTONEN 11E based on 5.6 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Employs a multi-dimensional template likelihood technique where the lepton plus jets (one or two b -tags) channel gives $172.2 \pm 1.2 \pm 0.9 \text{ GeV}$ while the dilepton channel yields $170.3 \pm 2.0 \pm 3.1 \text{ GeV}$. The results are combined. OUR EVALUATION includes the measurement in the dilepton channel only.
- 43 Uses a likelihood fit of the lepton p_T distribution based on 2.7 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$.
- 44 Based on 3.6 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. ABAZOV 11P reports $174.94 \pm 0.83 \pm 0.78 \pm 0.96 \text{ GeV}$, where the first uncertainty is from statistics, the second from JES, and the last from other systematic uncertainties. We combine the JES and systematic uncertainties. A matrix-element method is used where the JES uncertainty is constrained by the W mass. ABAZOV 11P describes a measurement based on 2.6 fb^{-1} that is combined with ABAZOV 08AH, which employs an independent 1 fb^{-1} of data.
- 45 Based on a matrix-element method which employs 5.4 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Superseded by ABAZOV 12AB.
- 46 Based on 36 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$. A Kinematic Method using b -tagging and an analytical Matrix Weighting Technique give consistent results and are combined. Superseded by CHATRCHYAN 12BA.
- 47 Based on 5.6 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The likelihood calculated using a matrix element method gives $m_t = 173.0 \pm 0.7(\text{stat}) \pm 0.6(\text{JES}) \pm 0.9(\text{syst}) \text{ GeV}$, for a total uncertainty of 1.2 GeV .
- 48 Based on 3.4 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The result is obtained by combining the MT2 variable method and the NWA (Neutrino Weighting Algorithm). The MT2 method alone gives $m_t = 168.0^{+4.8}_{-4.0}(\text{stat}) \pm 2.9(\text{syst}) \text{ GeV}$ with smaller systematic error due to small JES uncertainty.
- 49 Based on 1.9 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The result is from the measurement using the transverse decay length of b -hadrons and that using the transverse momentum of the W decay muons, which are both insensitive to the JES (jet energy scale) uncertainty. OUR EVALUATION uses only the measurement exploiting the decay length significance which yields $166.9^{+9.5}_{-8.5}(\text{stat}) \pm 2.9(\text{syst}) \text{ GeV}$. The measurement that uses the lepton transverse momentum is excluded from the average because of a statistical correlation with other samples.
- 50 Based on 2.9 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and JES uncertainty, and the latter is from the other systematics. Neural-network-based kinematical selection of 6 highest E_T jets with a $vt\bar{t}$ b -tag is used to distinguish signal from background. Superseded by AALTONEN 12G.
- 51 Based on 2 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The top mass is obtained from the measurement of the invariant mass of the lepton (e or μ) from W decays and the soft μ in b -jet. The result is insensitive to jet energy scaling.
- 52 Based on 1.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and jet energy scale uncertainty, and the latter is from the other systematics. Matrix element method with effective propagators.
- 53 Based on 943 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistical and jet-energy-scale uncertainties, and the latter is from other systematics. AALTONEN 09k selected 6 jet events with one or more vertex b -tags and used the tree-level matrix element to construct template models of signal and background.
- 54 Based on 1.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistical and jet-energy-scale (JES) uncertainties, and the second is from other systematics. Events with lepton + jets and those with dilepton + jets were simultaneously fit to constrain m_t and JES. Lepton + jets data only give $m_t = 171.8 \pm 2.2 \text{ GeV}$, and dilepton data only give $m_t = 171.2^{+5.3}_{-5.1} \text{ GeV}$.
- 55 Based on 2 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Matrix Element method. Optimal selection criteria for candidate events with two high p_T leptons, high E_T , and two or more jets with and without b -tag are obtained by neural network with neuroevolution technique to minimize the statistical error of m_t .
- 56 Based on 2.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Mass m_t is estimated from the likelihood for the eight-fold kinematical solutions in the plane of the azimuthal angles of the two neutrino momenta.
- 57 Based on 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Events with two identified leptons, and those with one lepton plus one isolated track and a b -tag were used to constrain m_t . The result is a combination of the ν WT (ν Weighting Technique) result of $176.2 \pm 4.8 \pm 2.1 \text{ GeV}$ and the MWT (Matrix-element Weighting Technique) result of $173.2 \pm 4.9 \pm 2.0 \text{ GeV}$.
- 58 Reports measurement of $170.7^{+4.2}_{-3.9} \pm 2.6 \pm 2.4 \text{ GeV}$ based on 1.2 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The last error is due to the theoretical uncertainty on $\sigma_{t\bar{t}}$. Without the cross-section constraint a top mass of $169.7^{+5.2}_{-4.9} \pm 3.1 \text{ GeV}$ is obtained.
- 59 Template method.
- 60 Result is based on 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and jet energy scale uncertainty, and the latter is from the other systematics.
- 61 Based on 310 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 62 Ideogram method.
- 63 Based on 311 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Events with 4 or more jets with $E_T > 15 \text{ GeV}$, significant missing E_T , and secondary vertex b -tag are used in the fit. About 44% of the signal acceptance is from $\tau\nu + 4$ jets. Events with identified e or μ are vetoed to provide a statistically independent measurement.
- 64 Based on 1.02 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Superseded by AALTONEN 12G.
- 65 Based on 955 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. m_t and JES (Jet Energy Scale) are fitted simultaneously, and the first error contains the JES contribution of 1.5 GeV .
- 66 Matrix element method.
- 67 Based on 425 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is a combination of statistics and JES (Jet Energy Scale) uncertainty, which has been measured simultaneously to give $JES = 0.989 \pm 0.029(\text{stat})$.
- 68 Based on 370 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Combined result of MWT (Matrix-element Weighting Technique) and ν WT (ν Weighting Technique) analyses is $178.1 \pm 6.7 \pm 4.8 \text{ GeV}$.
- 69 Based on 1.0 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. ABULENCIA 07D improves the matrix element description by including the effects of initial-state radiation.
- 70 Based on 695 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The transverse decay length of the b hadron is used to determine m_t , and the result is free from the JES (jet energy scale) uncertainty.
- 71 Based on $\sim 400 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error includes statistical and systematic jet energy scale uncertainties, the second error is from the other systematics. The result is obtained with the b -tagging information. The result without b -tagging is $169.2^{+5.0+1.5}_{-7.4-1.4} \text{ GeV}$. Superseded by ABAZOV 08AH.
- 72 Based on 318 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 73 Dynamical likelihood method.
- 74 Based on 340 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 75 Based on 360 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 76 Based on $110.2 \pm 5.8 \text{ pb}^{-1}$ at $\sqrt{s} = 1.8 \text{ TeV}$.
- 77 Based on the all hadronic decays of $t\bar{t}$ pairs. Single b -quark tagging via the decay chain $b \rightarrow c \rightarrow \mu$ was used to select signal enriched multijet events. The result was obtained by the maximum likelihood method after bias correction.
- 78 Obtained by re-analysis of the lepton + jets candidate events that led to ABBOTT 98F. It is based upon the maximum likelihood method which makes use of the leading order matrix elements.
- 79 Based on $125 \pm 7 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$.
- 80 Based on $\sim 106 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$.
- 81 Obtained by combining the measurements in the lepton + jets [AFFOLDER 01], all-jets [ABE 97R, ABE 99B], and dilepton [ABE 99B] decay topologies.
- 82 Obtained by combining the D0 result $m_t(\text{GeV}) = 168.4 \pm 12.3 \pm 3.6$ from 6 di-lepton events (see also ABBOTT 98D) and $m_t(\text{GeV}) = 173.3 \pm 5.6 \pm 5.5$ from lepton+jets events (ABBOTT 98F).
- 83 Obtained by combining the CDF results of $m_t(\text{GeV}) = 167.4 \pm 10.3 \pm 4.8$ from 8 dilepton events, $m_t(\text{GeV}) = 175.9 \pm 4.8 \pm 5.3$ from lepton+jets events (ABE 98E), and $m_t(\text{GeV}) = 186.0 \pm 10.0 \pm 5.7$ from all-jet events (ABE 97R). The systematic errors in the latter two measurements are changed in this paper.
- 84 See AFFOLDER 01 for details of systematic error re-evaluation.
- 85 Based on $109 \pm 7 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$.
- 86 See ABAZOV 04G.
- 87 The updated systematic error is listed. See AFFOLDER 01, appendix C.
- 88 Obtained by combining the D0 results of $m_t(\text{GeV}) = 168.4 \pm 12.3 \pm 3.6$ from 6 dilepton events and $m_t(\text{GeV}) = 173.3 \pm 5.6 \pm 5.5$ from 77 lepton+jets events.
- 89 Obtained by combining the D0 results from dilepton and lepton+jets events, and the CDF results (ABE 99B) from dilepton, lepton+jets events, and all-jet events.
- 90 Based on the first observation of all hadronic decays of $t\bar{t}$ pairs. Single b -quark tagging with jet-shape variable constraints was used to select signal enriched multi-jet events. The updated systematic error is listed. See AFFOLDER 01, appendix C.

t-Quark Mass from Cross-Section Measurements

The top quark $M\bar{S}$ or pole mass can be extracted from a measurement of $\sigma(t\bar{t})$ by using theory calculations. We quote below the $M\bar{S}$ mass. See the review "The Top Quark" and references therein for more information.

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹ AAD 19g based on 20.2 fb⁻¹ of data in *pp* collisions at $\sqrt{s} = 8$ TeV. Normalized $t\bar{t}$ + 1-jet differential cross section as a function of $t\bar{t}j$ invariant mass is measured in the $\ell +$ jets mode. The unfolded parton-level distribution is compared with the NLO QCD prediction. The three errors are from statistics, systematics, and theory.

² Based on 5.3 fb⁻¹ in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. ABAZOV 11s uses the measured $t\bar{t}$ production cross section of $8.13^{+1.02}_{-0.90}$ pb [ABAZOV 11E] in the lepton plus jets channel to obtain the top quark \overline{MS} mass by using an approximate NNLO computation (MOCH 08, LANGENFELD 09). The corresponding top quark pole mass is $167.5^{+5.4}_{-4.9}$ GeV. A different theory calculation (AHRENS 10, AHRENS 10A) is also used and yields $m_t^{\overline{MS}} = 154.5^{+5.0}_{-4.3}$ GeV.

³ Based on 1 fb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. Uses the $\ell +$ jets, $\ell\ell$, and $\ell\tau +$ jets channels. ABAZOV 09AG extract the pole mass of the top quark using two different calculations that yield $169.1^{+5.9}_{-5.2}$ GeV (MOCH 08, LANGENFELD 09) and $168.2^{+5.9}_{-5.4}$ GeV (KIDONAKIS 08).

⁴ Based on 1 fb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. Uses the $\ell\ell$ and $\ell\tau +$ jets channels. ABAZOV 09R extract the pole mass of the top quark using two different calculations that yield $173.3^{+9.8}_{-8.6}$ GeV (MOCH 08, LANGENFELD 09) and $171.5^{+9.9}_{-8.8}$ GeV (CACIARI 08).

176.7±3.0 ^{+2.8} _{-2.8}	8 CHATRCHYAN14	CMS	$p\bar{p}$ at $\sqrt{s} = 7$ TeV

¹ AAD 19g based on 20.2 fb⁻¹ of data in *pp* collisions at $\sqrt{s} = 8$ TeV. Normalized $t\bar{t}$ + 1-jet differential cross section as a function of $t\bar{t}j$ invariant mass is measured in the $\ell +$ jets mode. The unfolded parton-level distribution is compared with the NLO QCD prediction. The three errors are from statistics, systematics, and theory.

² AABOUD 17bC based on 20.2 fb⁻¹ of *pp* data at $\sqrt{s} = 8$ TeV. The pole mass is extracted from a fit of NLO predictions to eight single lepton and dilepton differential distributions, while simultaneously constraining uncertainties due to PDFs and QCD scales. The three reported uncertainties come from statistics, experimental systematics, and theoretical sources.

³ SIRUNYAN 17W based on 2.2 fb⁻¹ of *pp* data at $\sqrt{s} = 13$ TeV. Events are categorized according to the jet multiplicity and the number of *b*-tagged jets. The pole mass is obtained from the inclusive cross section measurement and the NNLO prediction.

⁴ ABAZOV 16F based on 9.7 fb⁻¹ of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. The result is obtained from the inclusive cross section measurement and the NNLO+NNLL prediction.

⁵ KHACHATRYAN 16AW based on 5.0 fb⁻¹ of *pp* collisions at 7 TeV and 19.7 fb⁻¹ at 8 TeV. The 7 TeV data include those used in CHATRCHYAN 14. The result is obtained from the inclusive cross sections.

⁶ AAD 15BW based on 4.6 fb⁻¹ of *pp* data at $\sqrt{s} = 7$ TeV. Uses normalized differential cross section for $t\bar{t} + 1$ jet as a function of the inverse of the invariant mass of the $t\bar{t} + 1$ jet system. The measured cross section is corrected to the parton level. Then a fit to the data using NLO + parton shower prediction is performed.

⁷ AAD 14AY used $\sigma(t\bar{t})$ for $e\mu$ events. The result is a combination of the measurements $m_t = 171.4 \pm 2.6$ GeV based on 4.6 fb⁻¹ of data at 7 TeV and $m_t = 174.1 \pm 2.6$ GeV based on 20.3 fb⁻¹ of data at 8 TeV.

⁸ CHATRCHYAN 14 used $\sigma(t\bar{t})$ from $p\bar{p}$ collisions at $\sqrt{s} = 7$ TeV measured in CHATRCHYAN 12AX to obtain $m_t(\text{pole}) = 0.1184 \pm 0.0007$. The errors have been corrected in KHACHATRYAN 14K.

$$m_t - m_{\bar{t}}$$

¹ Based on 20.2 fb⁻¹ of *pp* data at $\sqrt{s} = 8$ TeV. Γ_t is measured using a template fit to the reconstructed invariant mass of the *b*-jet of the semileptonically decaying top quark and the corresponding lepton, and the angular distance between j_b and j_l in hadronic top decay. Signal templates are generated by reweighting events at parton-level to Breit-Wigner distribution with different Γ_t hypotheses for $m_t = 172.5$ GeV. The result is consistent with the NNLO SM prediction of 1.322 GeV.

² Based on 19.7 fb⁻¹ of *pp* data at $\sqrt{s} = 8$ TeV. The result is obtained by combining the measurement of $R = \Gamma(t \rightarrow Wb)/\Gamma(t \rightarrow Wq (q=b,s,d))$ and a previous CMS measurement of the *t*-channel single top production cross section of CHATRCHYAN 12BQ, by using the theoretical calculation of $\Gamma(t \rightarrow Wb)$ for $m_t = 172.5$ GeV.

³ Based on 5.4 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. $\Gamma(t \rightarrow bW) = 1.87^{+0.44}_{-0.40}$ GeV is obtained from the observed *t*-channel single top quark production cross section, whereas $\Gamma(t \rightarrow bW) = 0.90 \pm 0.04$ is used assuming $\sum_q \Gamma(t \rightarrow qW) = 1$. The result is valid for $m_t = 172.5$ GeV. See the paper for the values for $m_t = 170$ or 175 GeV.

⁴ Based on 8.7 fb⁻¹ of data. The two sided 68% CL interval is $1.10 \text{ GeV} < \Gamma_t < 4.05 \text{ GeV}$ for $m_t = 172.5$ GeV.

⁵ Based on 2.3 fb⁻¹ in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. ABAZOV 11B extracted Γ_t from the partial width $\Gamma(t \rightarrow Wb) = 1.92^{+0.58}_{-0.51}$ GeV measured using the *t*-channel single top production cross section, and the branching fraction $\text{br}(t \rightarrow Wb) = 0.962^{+0.068}_{-0.066}(\text{stat})^{+0.064}_{-0.052}(\text{sys})$. The $\Gamma(t \rightarrow Wb)$ measurement gives the 95% CL lowerbound of $\Gamma(t \rightarrow Wb)$ and hence that of Γ_t .

⁶ Results are based on 4.3 fb⁻¹ of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. The top quark mass and the hadronically decaying *W* boson mass are reconstructed for each candidate events and compared with templates of different top quark width. The two sided 68% CL interval is $0.3 \text{ GeV} < \Gamma_t < 4.4 \text{ GeV}$ for $m_t = 172.5$ GeV.

⁷ Based on 955 pb⁻¹ of $p\bar{p}$ collision data at $\sqrt{s} = 1.96$ TeV. AALTONEN 09M selected $t\bar{t}$ candidate events for the $\ell + E_T +$ jets channel with one or two *b*-tags, and examine the decay width dependence of the reconstructed m_t distribution. The result is for $m_t = 175$ GeV, whereas the upper limit is lower for smaller m_t .

¹ Based on 8.7 fb⁻¹ of data. This measurement gives $|V_{tb}| = 0.93 \pm 0.04$ and $|V_{tb}| > 0.85$ (95% CL) in the SM.

² Based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The result is obtained by counting the number of b jets per $t\bar{t}$ signal events in the dilepton channel. The $t\bar{t}$ production cross section is measured to be $\sigma(t\bar{t}) = 238 \pm 1 \pm 15$ pb, in good agreement with the SM prediction and the latest CMS measurement of CHATRCHYAN 14F. The measurement gives $R > 0.995$ (95% CL), or $|V_{tb}| > 0.975$ (95% CL) in the SM, requiring $R \leq 1$.

³ Based on 8.7 fb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. Measure the fraction of $t \rightarrow Wb$ decays simultaneously with the $t\bar{t}$ cross section. The correlation coefficient between those two measurements is -0.434 . Assume unitarity of the 3×3 CKM matrix and set $|V_{tb}| > 0.89$ at 95% CL.

⁴ Based on 5.4 fb⁻¹ of data. The error is statistical and systematic combined. The result is a combination of 0.95 ± 0.07 from $\ell +$ jets channel and 0.86 ± 0.05 from $\ell\ell$ channel. $|V_{tb}| = 0.95 \pm 0.02$ follows from the result by assuming unitarity of the 3×3 CKM matrix.

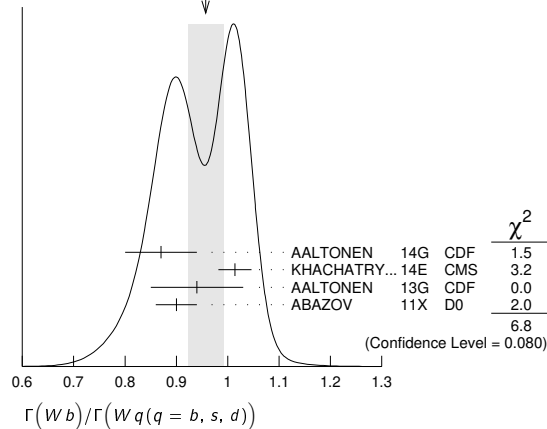

⁵ Result is based on 0.9 fb⁻¹ of data. The 95% CL lower bound $R > 0.79$ gives $|V_{tb}| > 0.89$ (95% CL).

⁶ ABAZOV 06k result is from the analysis of $t\bar{t} \rightarrow \ell\nu + \geq 3$ jets with 230 pb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. It gives $R > 0.61$ and $|V_{tb}| > 0.78$ at 95% CL. Superseded by ABAZOV 08M.

⁷ ACOSTA 05A result is from the analysis of lepton + jets and di-lepton + jets final states of $t\bar{t}$ candidate events with ~ 162 pb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. The first error is statistical and the second systematic. It gives $R > 0.61$, or $|V_{tb}| > 0.78$ at 95% CL.

⁸ AFFOLDER 01c measures the top-quark decay width ratio $R = \Gamma(Wb)/\Gamma(Wq)$, where q is a d , s , or b quark, by using the number of events with multiple b tags. The first error is statistical and the second systematic. A numerical integration of the likelihood function gives $R > 0.61$ (0.56) at 90% (95%) CL. By assuming three generation unitarity, $|V_{tb}| = 0.97^{+0.16}_{-0.12}$ or $|V_{tb}| > 0.78$ (0.75) at 90% (95%) CL is obtained. The result is based on 109 pb⁻¹ of data at $\sqrt{s} = 1.8$ TeV.

³ ABULENCIA	06R CDF	$\ell\tau +$ jets
⁴ ABE	97V CDF	$\ell\tau +$ jets

¹ AAD 15cc based on 4.6 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. The original value is given by $7.0 \pm 0.3 \pm 0.5\%$, which includes only the hadronic decay of τ leptons. It is assumed that the top branching ratios to leptons and jets add up to one and that only SM processes contribute to the background. The event selection criteria are optimized for the $\ell\tau_h +$ jets channel. We have converted the original value to include leptonic decays of τ 's, by using the AAD 15cc measurements of the branching ratios to e and μ channels, as well as the PDG values of τ branching ratios into e and μ channels.

² Based on 9 fb⁻¹ of data. The measurement is in the channel $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$, where τ decays into hadrons (τ_h), and ℓ (e or μ) include ℓ from τ decays (τ_ℓ). The result is consistent with lepton universality.

³ ABULENCIA 06R looked for $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau\nu_\tau)b\bar{b}$ events in 194 pb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. 2 events are found where 1.00 ± 0.17 signal and 1.29 ± 0.25 background events are expected, giving a 95% CL upper bound for the partial width ratio $\Gamma(t \rightarrow \tau\nu q) / \Gamma_{SM}(t \rightarrow \tau\nu q) < 5.2$.

⁴ ABE 97V searched for $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau\nu_\tau)b\bar{b}$ events in 109 pb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.8$ TeV. They observed 4 candidate events where one expects ~ 1 signal and ~ 2 background events. Three of the four observed events have jets identified as b candidates.

¹ AAD 20B based on 81 fb⁻¹ of data in pp collisions at $\sqrt{s} = 13$ TeV. FCNC through single top production in association with a photon is searched for in the mode $\ell\gamma + E_T + 1j$ (b -tag). Anomalous FCNC left-handed and right-handed couplings are searched for, which result in different kinematical properties of top decay such as the lepton distribution. Limits are set on the $tq\gamma$ couplings in an effective field theory.

² KHACHATRYAN 16AS based on 19.8 fb⁻¹ of data in pp collisions at $\sqrt{s} = 8$ TeV. FCNC through single top production in association with a photon is searched for in the mode $\mu + \gamma + E_T + \geq 1j$ (0,1b). Bounds on the anomalous FCNC couplings are given by $\kappa_{t u \gamma} < 0.025$ and $\kappa_{t c \gamma} < 0.091$.

³ CHEKANOV 03 looked for single top production via FCNC in the reaction $e^\pm p \rightarrow e^\pm (t$ or $\bar{t}) X$ in 130.1 pb⁻¹ of data at $\sqrt{s} = 300$ –318 GeV. No evidence for top production and its decay into bW was found. The result is obtained for $m_t = 175$ GeV when $B(\gamma c) = B(Zq) = 0$, where q is a u or c quark. Bounds on the effective t - u - γ and t - u - Z couplings are found in their Fig. 4. The conversion to the constraint listed is from private communication, E. Gallo, January 2004.

⁴ AARON 09A looked for single top production via FCNC in $e^\pm p$ collisions at HERA with 474 pb⁻¹. The upper bound of the cross section gives the bound on the FCNC coupling $\kappa_{t u \gamma} / \Lambda < 1.03$ TeV⁻¹, which corresponds to the result for $m_t = 175$ GeV.

⁵ ABDALLAH 04c looked for single top production via FCNC in the reaction $e^+ e^- \rightarrow \bar{t} c$ or $\bar{t} u$ in 541 pb⁻¹ of data at $\sqrt{s} = 189$ –208 GeV. No deviation from the SM is found, which leads to the bound on $B(t \rightarrow \gamma q)$, where q is a u or a c quark, for $m_t = 175$ GeV when $B(\gamma c) = B(Zq) = 0$ is assumed. The conversion to the listed bound is from private communication, O. Yushchenko, April 2005. The bounds on the effective t - q - γ and t - q - Z couplings are given in their Fig. 7 and Table 4, for $m_t = 170$ –180 GeV, where most conservative bounds are found by choosing the chiral couplings to maximize the negative interference between the virtual γ and Z exchange amplitudes.

⁶ AKTAS 04 looked for single top production via FCNC in e^\pm collisions at HERA with 118.3 pb⁻¹, and found 5 events in the e or μ channels. By assuming that they are due to statistical fluctuation, the upper bound on the $t u \gamma$ coupling $\kappa_{t u \gamma} < 0.27$ (95% CL) is obtained. The conversion to the partial width limit, when $B(\gamma c) = B(Zu) = B(Zc) = 0$, is from private communication, E. Perez, May 2005.

⁷ ACHARD 02J looked for single top production via FCNC in the reaction $e^+ e^- \rightarrow \bar{t} c$ or $\bar{t} u$ in 634 pb⁻¹ of data at $\sqrt{s} = 189$ –209 GeV. No deviation from the SM is found, which leads to a bound on the top-quark decay branching fraction $B(\gamma q)$, where q is a u or c quark. The bound assumes $B(Zq) = 0$ and is for $m_t = 175$ GeV; bounds for $m_t = 170$ GeV and 180 GeV and $B(Zq) \neq 0$ are given in Fig. 5 and Table 7.

⁸ ABE 98G looked for $t\bar{t}$ events where one t decays into $q\gamma$ while the other decays into bW . The quoted bound is for $\Gamma(\gamma q)/\Gamma(Wb)$.

¹Based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. The final states $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu + \text{jets}$ ($\ell, \ell' = e, \mu$) are investigated and no significant excess over the SM background contributions is observed.

²SIRUNYAN 17E based on 19.7 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The final states $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu + \text{jets}$ ($\ell, \ell' = e, \mu$) are investigated and the cross section $\sigma(pp \rightarrow tZq \rightarrow \ell \nu b \ell^+ \ell^- q) = 10^{+8}_{-7} \text{ fb}$ is measured, giving no sign of FCNC decays of the top quark.

³AAD 16D based on 20.3 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The FCNC decay is searched for in $t\bar{t}$ events in the final state $(bW)(qZ)$ when both W and Z decay leptonically, giving 3 charged leptons.

⁴CHATRCHYAN 14S combined search limit from this and CHATRCHYAN 13F data.

⁵Based on 19.7 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The flavor changing decay is searched for in $t\bar{t}$ events in the final state $(bW)(qZ)$ when both W and Z decay leptonically, giving 3 charged leptons.

⁶Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. Search for FCNC decays of the top quark in $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu + \text{jets}$ ($\ell, \ell' = e, \mu$) final states found no excess of signal events.

⁷Based on 2.1 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$.

⁸Based on 4.1 fb^{-1} of data. ABAZOV 11M searched for FCNC decays of the top quark in $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu + \text{jets}$ ($\ell, \ell' = e, \mu$) final states, and absence of the signal gives the bound.

⁹Based on pp data of 1.52 fb^{-1} . AALTONEN 09AL compared $t\bar{t} \rightarrow WbWb \rightarrow \ell \nu b j j b$ and $t\bar{t} \rightarrow ZcWb \rightarrow \ell \ell j j b$ decay chains, and absence of the latter signal gives the bound. The result is for 100% longitudinally polarized Z boson and the theoretical $t\bar{t}$ production cross section. The results for different Z polarizations and those without the cross section assumption are given in their Table XII.

¹⁰Result is based on 1.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. $t\bar{t} \rightarrow WbZq \text{ or } ZqZq$ processes have been looked for in $Z + \geq 4$ jet events with and without b -tag. No signal leads to the bound $B(t \rightarrow Zq) < 0.037 (0.041)$ for $m_t = 175 (170) \text{ GeV}$.

¹¹ABDALLAH 04C looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c \text{ or } \bar{t}u$ in 541 pb^{-1} of data at $\sqrt{s} = 189\text{--}208 \text{ GeV}$. No deviation from the SM is found, which leads to the bound on $B(t \rightarrow Zq)$, where q is a u or c quark, for $m_t = 175 \text{ GeV}$ when $B(t \rightarrow \gamma q) = 0$ is assumed. The conversion to the listed bound is from private communication, O. Yushchenko, April 2005. The bounds on the effective t - q - γ and t - q - Z couplings are given in their Fig. 7 and Table 4, for $m_t = 170\text{--}180 \text{ GeV}$, where most conservative bounds are found by choosing the chiral couplings to maximize the negative interference between the virtual γ and Z exchange amplitudes.

¹²ACHARD 02J looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c \text{ or } \bar{t}u$ in 634 pb^{-1} of data at $\sqrt{s} = 189\text{--}209 \text{ GeV}$. No deviation from the SM is found, which leads to a bound on the top-quark decay branching fraction $B(Zq)$, where q is a u or c quark. The bound assumes $B(\gamma q) = 0$ and is for $m_t = 175 \text{ GeV}$; bounds for $m_t = 170 \text{ GeV}$ and 180 GeV and $B(\gamma q) \neq 0$ are given in Fig. 5 and Table 7. Table 6 gives constraints on t - c - e four-fermi contact interactions.

¹³HEISTER 02Q looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c \text{ or } \bar{t}u$ in 214 pb^{-1} of data at $\sqrt{s} = 204\text{--}209 \text{ GeV}$. No deviation from the SM is found, which leads to a bound on the branching fraction $B(Zq)$, where q is a u or c quark. The bound assumes $B(\gamma q) = 0$ and is for $m_t = 174 \text{ GeV}$. Bounds on the effective t - $(c \text{ or } u)$ - γ and t - $(c \text{ or } u)$ - Z couplings are given in their Fig. 2.

¹⁴ABBIENDI 01T looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c \text{ or } \bar{t}u$ in 600 pb^{-1} of data at $\sqrt{s} = 189\text{--}209 \text{ GeV}$. No deviation from the SM is found, which leads to bounds on the branching fractions $B(Zq)$ and $B(\gamma q)$, where q is a u or c quark. The result is obtained for $m_t = 174 \text{ GeV}$. The upper bound becomes 9.7% (20.6%) for $m_t = 169 (179) \text{ GeV}$. Bounds on the effective t - $(c \text{ or } u)$ - γ and t - $(c \text{ or } u)$ - Z couplings are given in their Fig. 4.

¹⁵BARATE 00S looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{t}c \text{ or } \bar{t}u$ in 411 pb^{-1} of data at c.m. energies between 189 and 202 GeV. No deviation from the SM is found, which leads to a bound on the branching fraction. The bound assumes $B(\gamma q) = 0$. Bounds on the effective t - $(c \text{ or } u)$ - γ and t - $(c \text{ or } u)$ - Z couplings are given in their Fig. 4.

¹⁶ABE 98G looked for $t\bar{t}$ events where one t decays into three jets and the other decays into qZ with $Z \rightarrow \ell\ell$. The quoted bound is for $\Gamma(Zq)/\Gamma(Wb)$.

¹AABOUD 17BB based on 20.2 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. Triple-differential decay rate of top quark in the t -channel single-top production is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. No assumption is made for the other couplings. See this paper for constraints on other couplings not included here. The paper reported f_1 , and we converted it to F_0 .

²KHACHATRYAN 16BU based on 19.8 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$ using $t\bar{t}$ events with $\ell + E_T + \geq 4$ jets ($\geq 2 b$). The errors of F_0 and F_{\pm} are correlated with a correlation coefficient $\rho(F_0, F_{\pm}) = -0.87$. The result is consistent with the NNLO SM prediction of 0.687 ± 0.005 for $m_t = 172.8 \pm 1.3 \text{ GeV}$.

³Based on 8.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ using $t\bar{t}$ events with $\ell + E_T + \geq 4$ jets ($\geq 1 b$), and under the constraint $F_0 + F_{\pm} + F_{\mp} = 1$. The statistical errors of F_0 and F_{\pm} are correlated with correlation coefficient $\rho(F_0, F_{\pm}) = -0.69$.

⁴Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 13BH studied tt events with large E_T and $\ell + \geq 4$ jets using a constrained kinematic fit.

⁵Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. AAD 12BG studied tt events with large E_T and either $\ell + \geq 4j$ or $\ell\ell + \geq 2j$. The uncertainties are not independent, $\rho(F_0, F_{\pm}) = -0.96$.

⁶Based on 2.7 and 5.1 fb^{-1} of CDF data in $\ell +$ jets and dilepton channels, and 5.4 fb^{-1} of D0 data in $\ell +$ jets and dilepton channels. $F_0 = 0.682 \pm 0.035 \pm 0.046$ if $F_{\pm} = 0.0017(1)$, while $F_{\pm} = -0.015 \pm 0.018 \pm 0.030$ if $F_0 = 0.688(4)$, where the assumed fixed values are the SM prediction for $m_t = 173.3 \pm 1.1 \text{ GeV}$ and $m_W = 80.399 \pm 0.023 \text{ GeV}$.

⁷Results are based on 5.4 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV , including those of ABAZOV 08B. Under the SM constraint of $f_0 = 0.698$ (for $m_t = 173.3 \text{ GeV}$, $m_W = 80.399 \text{ GeV}$), $f_{\pm} = 0.010 \pm 0.022 \pm 0.030$ is obtained.

⁸AFFOLDER 00B studied the angular distribution of leptonic decays of W bosons in $t \rightarrow Wb$ events. The ratio F_0 is the fraction of the helicity zero (longitudinal) W bosons in the decaying top quark rest frame. $B(t \rightarrow W_{\pm} b)$ is the fraction of positive helicity (right-handed) positive charge W bosons in the top quark decays. It is obtained by assuming the Standard Model value of F_0 .

⁹Results are based on 2.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. F_0 result is obtained by assuming $F_{\pm} = 0$, while F_{\pm} result is obtained for $F_0 = 0.70$, the SM value. Model independent fits for the two fractions give $F_0 = 0.88 \pm 0.11 \pm 0.06$ and $F_{\pm} = -0.15 \pm 0.07 \pm 0.06$ with correlation coefficient of -0.59 . The results are for $m_t = 175 \text{ GeV}$.

¹⁰Results are based on 1.9 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. F_0 result is obtained assuming $F_{\pm} = 0$, while F_{\pm} result is obtained for $F_0 = 0.70$, the SM values.

Model independent fits for the two fractions give $F_0 = 0.66 \pm 0.16 \pm 0.05$ and $F_{\pm} = -0.03 \pm 0.06 \pm 0.03$.

¹¹Based on 1 fb^{-1} at $\sqrt{s} = 1.96 \text{ TeV}$.

¹²Based on 318 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.

¹³Based on 200 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. $t \rightarrow Wb \rightarrow \ell\nu b$ ($\ell = e$ or μ). The errors are stat + syst.

¹⁴ABAZOV 05G studied the angular distribution of leptonic decays of W bosons in $t\bar{t}$ candidate events with lepton + jets final states, and obtained the fraction of longitudinally polarized W under the constraint of no right-handed current, $F_{\pm} = 0$. Based on 125 pb^{-1} of data at $\sqrt{s} = 1.8 \text{ TeV}$.

³Based on 8.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ using $t\bar{t}$ events with $\ell + E_T + \geq 4$ jets ($\geq 1 b$), and under the constraint $F_0 + F_{\pm} + F_{\mp} = 1$. The statistical errors of F_0 and F_{\pm} are correlated with correlation coefficient $\rho(F_0, F_{\pm}) = -0.69$.

⁴Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 13BH studied tt events with large E_T and $\ell + \geq 4$ jets using a constrained kinematic fit.

⁵Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. AAD 12BG studied tt events with large E_T and either $\ell + \geq 4j$ or $\ell\ell + \geq 2j$.

⁶Results are based on 5.4 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV , including those of ABAZOV 08B. Under the SM constraint of $f_0 = 0.698$ (for $m_t = 173.3 \text{ GeV}$, $m_W = 80.399 \text{ GeV}$), $f_{\pm} = 0.010 \pm 0.022 \pm 0.030$ is obtained.

⁷AFFOLDER 00B studied the angular distribution of leptonic decays of W bosons in $t \rightarrow Wb$ events. The ratio F_0 is the fraction of the helicity zero (longitudinal) W bosons in the decaying top quark rest frame. $B(t \rightarrow W_{\pm} b)$ is the fraction of positive helicity (right-handed) positive charge W bosons in the top quark decays. It is obtained by assuming the Standard Model value of F_0 .

⁸Based on 2.7 and 5.1 fb^{-1} of CDF data in $\ell +$ jets and dilepton channels, and 5.4 fb^{-1} of D0 data in $\ell +$ jets and dilepton channels. $F_0 = 0.682 \pm 0.035 \pm 0.046$ if $F_{\pm} = 0.0017(1)$, while $F_{\pm} = -0.015 \pm 0.018 \pm 0.030$ if $F_0 = 0.688(4)$, where the assumed

fixed values are the SM prediction for $m_t = 173.3 \pm 1.1$ GeV and $m_W = 80.399 \pm 0.023$ GeV.

- ⁹ Results are based on 2.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. F_0 result is obtained by assuming $F_{\pm} = 0$, while F_{\pm} result is obtained for $F_0 = 0.70$, the SM value. Model independent fits for the two fractions give $F_0 = 0.88 \pm 0.11 \pm 0.06$ and $F_{\pm} = -0.15 \pm 0.07 \pm 0.06$ with correlation coefficient of -0.59 . The results are for $m_t = 175$ GeV.
- ¹⁰ Results are based on 1.9 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. F_0 result is obtained assuming $F_{\pm} = 0$, while F_{\pm} result is obtained for $F_0 = 0.70$, the SM values. Model independent fits for the two fractions give $F_0 = 0.66 \pm 0.16 \pm 0.05$ and $F_{\pm} = -0.03 \pm 0.06 \pm 0.03$.
- ¹¹ Based on 1 fb^{-1} at $\sqrt{s} = 1.96$ TeV.
- ¹² Based on 370 pb^{-1} of data at $\sqrt{s} = 1.96$ TeV, using the $\ell + \text{jets}$ and dilepton decay channels. The result assumes $F_0 = 0.70$, and it gives $F_{\pm} < 0.23$ at 95% CL.
- ¹³ Based on 318 pb^{-1} of data at $\sqrt{s} = 1.96$ TeV.
- ¹⁴ Based on 200 pb^{-1} of data at $\sqrt{s} = 1.96$ TeV. $t \rightarrow Wb \rightarrow \ell\nu b$ ($\ell = e$ or μ). The errors are stat + syst.
- ¹⁵ ABAZOV 05L studied the angular distribution of leptonic decays of W bosons in $t\bar{t}$ events, where one of the W 's from t or \bar{t} decays into e or μ and the other decays hadronically. The fraction of the "+" helicity W boson is obtained by assuming $F_0 = 0.7$, which is the generic prediction for any linear combination of V and A currents. Based on $230 \pm 15 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.96$ TeV.
- ¹⁶ ACOSTA 05D measures the $m_{\ell^+ b}^2$ distribution in $t\bar{t}$ production events where one or both W 's decay leptonically to $\ell = e$ or μ , and finds a bound on the V+A coupling of the tbW vertex. By assuming the SM value of the longitudinal W fraction $F_0 = B(t \rightarrow W_0 b) = 0.70$, the bound on F_{\pm} is obtained. If the results are combined with those of AFFOLDER 00B, the bounds become $F_{V+A} < 0.61$ (95% CL) and $F_{\pm} < 0.18$ (95% CL), respectively. Based on $109 \pm 7 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8$ TeV (run I).

- ¹ AABOUD 17BB based on 20.2 fb^{-1} of pp data at $\sqrt{s} = 8$ TeV. Triple-differential decay rate of top quark is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. No assumption is made for the other couplings. See this paper for constraints on other couplings not included here.
- ² AABOUD 17I based on 20.2 fb^{-1} of pp data at $\sqrt{s} = 8$ TeV. A cut-based analysis is used to discriminate between signal and backgrounds. All anomalous couplings other than $\text{Im}(f_2^R)$ are assumed to be zero. See this paper for a number of other asymmetries and measurements that are not included here.
- ³ KHACHATRYAN 17G based on 5.0 and 19.7 fb^{-1} of pp data at $\sqrt{s} = 7$ and 8 TeV, respectively. A Bayesian neural network technique is used to discriminate between signal and backgrounds. This is a 95% CL exclusion limit obtained by a three-dimensional fit with simultaneous variation of (f_1^L, f_2^L, f_2^R) .
- ⁴ AAD 16AK based on 4.6 fb^{-1} of pp data at $\sqrt{s} = 7$ TeV. The results are obtained from an analysis of angular distributions of the decay products of single top quarks, assuming $f_1^L = f_2^L = 0$. The fraction of decays containing transversely polarized W is measured to be $F_{\pm} + F_{\mp} = 0.37 \pm 0.07$.
- ⁵ Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7$ TeV. AAD 12BG studied tt events with large E_T and either $\ell + \geq 4j$ or $\ell\ell + \geq 2j$.
- ⁶ Based on 5.4 fb^{-1} of data. For each value of the form factor quoted the other two are assumed to have their SM value. Their Fig. 4 shows two-dimensional posterior probability density distributions for the anomalous couplings.
- ⁷ Based on 5.4 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV. Results are obtained by combining the limits from the W helicity measurements and those from the single top quark production.
- ⁸ Based on 1 fb^{-1} of data at $p\bar{p}$ collisions $\sqrt{s} = 1.96$ TeV. Combined result of the W helicity measurement in $t\bar{t}$ events (ABAZOV 08B) and the search for anomalous tbW couplings in the single top production (ABAZOV 08AI). Constraints when f_1^L and one of the anomalous couplings are simultaneously allowed to vary are given in their Fig. 1 and Table 1.
- ⁹ Result is based on 0.9 fb^{-1} of data at $\sqrt{s} = 1.96$ TeV. Single top quark production events are used to measure the Lorentz structure of the tbW coupling. The upper bounds on the non-standard couplings are obtained when only one non-standard coupling is allowed to be present together with the SM one, $f_1^L = V_{tb}^*$.

 $|f_{LV} V_{tb}|$

Assumed that the top-quark-related CKM matrix elements obey the relation $|V_{td}|, |V_{ts}| \ll |V_{tb}|$ and a form factor f_{LV} is determined for each production mode and centre-of-mass energy.

Spin Correlation in $t\bar{t}$ Production in $p\bar{p}$ Collisions

C is the correlation strength parameter, f is the ratio of events with correlated t and \bar{t} spins (SM prediction: f = 1), and κ is the spin correlation coefficient. See "The Top Quark" review for more information.

¹ ABAZOV 16A based on 9.7 fb⁻¹ of data. A matrix element method is used. It corresponds to evidence of spin correlation at 4.2 σ and is in agreement with the NLO SM prediction $0.80^{+0.01}_{-0.02}$.

² This is a combination of the lepton + jets analysis presented in ABAZOV 12B and the dilepton measurement of ABAZOV 11AE. It provides a 3.1 σ evidence for the $t\bar{t}$ spin correlation.

³ Based on 5.3 fb⁻¹ of data. The error is statistical and systematic combined. A matrix element method is used.

⁴ Based on 4.3 fb⁻¹ of data. The measurement is based on the angular study of the top quark decay products in the helicity basis. The theory prediction is $\kappa \approx 0.40$.

⁵ Based on 5.4 fb⁻¹ of data using a matrix element method. The error is statistical and systematic combined. The no-correlation hypothesis is excluded at the 97.7% CL.

⁶ Based on 5.4 fb⁻¹ of data. The error is statistical and systematic combined. The NLO QCD prediction is C = 0.78 \pm 0.03. The neutrino weighting method is used for reconstruction of kinematics.

Spin Correlation in $t\bar{t}$ Production in pp Collisions

Spin correlation, f_{SM} , measures the strength of the correlation between the spins of the pair produced $t\bar{t}$. $f_{SM} = 1$ for the SM, while $f_{SM} = 0$ for no spin correlation.

¹ KHACHATRYAN 17G based on 5.0 and 19.7 fb⁻¹ of pp data at $\sqrt{s} = 7$ and 8 TeV, respectively. t-channel single top production is used. The result corresponds to $B(t \rightarrow ug) < 2.0 \times 10^{-5}$ or $B(t \rightarrow cg) < 4.1 \times 10^{-4}$.

² AAD 16As based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The results are obtained from the 95% CL upper limit on the single top-quark production $\sigma(qg \rightarrow t) \cdot B(t \rightarrow bW) < 3.4$ pb, $B(t \rightarrow ug) < 4.0 \times 10^{-5}$ and $B(t \rightarrow cg) < 2.0 \times 10^{-5}$.

³ Based on 2.05 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. The results are obtained from the 95% CL upper limit on the single top-quark production $\sigma(qg \rightarrow t) \cdot B(t \rightarrow bW) < 3.9$ pb, for $u=q$ or $q=c$, $B(t \rightarrow ug) < 5.7 \times 10^{-5}$ and $B(t \rightarrow cg) < 2.7 \times 10^{-4}$.

⁴ Based on 2.3 fb⁻¹ of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. Upper limit of single top quark production cross section 0.20 pb and 0.27 pb via FCNC t-u-g and t-c-g couplings, respectively, lead to the bounds without assuming the absence of the other coupling. $B(t \rightarrow u + g) < 2.0 \times 10^{-4}$ and $B(t \rightarrow c + g) < 3.9 \times 10^{-3}$ follow.

⁵ Based on 2.2 fb⁻¹ of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. Upper limit of single top quark production cross section $\sigma(u(c) + g \rightarrow t) < 1.8$ pb (95% CL) via FCNC t-u-g and t-c-g couplings lead to the bounds. $B(t \rightarrow u + g) < 3.9 \times 10^{-4}$ and $B(t \rightarrow c + g) < 5.7 \times 10^{-3}$ follow.

⁶ Result is based on 230 pb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. Absence of single top quark production events via FCNC t-u-g and t-c-g couplings lead to the upper bounds on the dimensioned couplings, κ^{tug}/Λ and κ^{ctg}/Λ , respectively.

t-Quark Yukawa Coupling from $t\bar{t}$ Kinematic Distributions in pp Collisions

The ratio of t-quark Yukawa coupling to its standard model predicted value.

¹ SIRUNYAN 19R based on 35.9 fb⁻¹ of pp data at 13 TeV. Multivariate techniques are employed to separate the signal from the dominant $t\bar{t} + \text{jets}$ background. The result is for $m_H = 125$ GeV. The measured ratio corresponds to a signal significance of 1.6 σ above the background-only hypothesis.

² SIRUNYAN 18BD based on 35.9 fb⁻¹ of pp data at 13 TeV. A combined fit of signal and background templates to data is performed in six event categories separated by jet and b-jet multiplicities. An upper limit of 3.8 is obtained for the cross section ratio.

³ SIRUNYAN 18L based on up to 5.1, 19.7, and 35.9 fb⁻¹ of pp data at 7, 8, and 13 TeV, respectively. An excess of events is observed, with a significance of 5.2 standard deviations, over the expectation from the background-only hypothesis. The result is for the Higgs boson mass of 125.09 GeV.

⁴ Based on 4.5 fb⁻¹ of data at 7 TeV and 20.3 fb⁻¹ at 8 TeV. The result is for $m_H = 125.4$ GeV. The measurement constrains the top quark Yukawa coupling strength parameter $\kappa_t = Y_t/Y_t^{SM}$ to be $-1.3 < \kappa_t < 8.0$ (95% CL).

⁵ Based on 5.1 fb^{-1} of pp data at 7 TeV and 19.7 fb^{-1} at 8 TeV. The results are obtained by assuming the SM decay branching fractions for the Higgs boson of mass 125.6 GeV. The signal strength for individual Higgs decay channels are given in Fig. 13, and the preferred region in the (κ_V, κ_f) space is given in Fig. 14.

Single t -Quark Production Cross Section in $p\bar{p}$ Collisions at $\sqrt{s} = 1.8 \text{ TeV}$

¹ AALTONEN 16 based on 9.5 fb^{-1} of data. This includes, as a part, the result of AALTONEN 14K. Combination of this result with that of AALTONEN 14o gives a $s + t$ cross section of $3.02^{+0.49}_{-0.48} \text{ pb}$ and $|V_{tb}| > 0.84$ (95% CL).

² AALTONEN 15H based on 9.7 fb^{-1} of data per experiment. The result is for $m_t = 172.5 \text{ GeV}$, and is a combination of the CDF measurements (AALTONEN 16) and the D0 measurements (ABAZOV 13o) on the t -channel single t -quark production cross section. The result is consistent with the NLO+NNLL SM prediction and gives $|V_{tb}| = 1.02^{+0.06}_{-0.05}$ and $|V_{tb}| > 0.92$ (95% CL).

³ AALTONEN 15H is a combined measurement of s -channel single top cross section by CDF + D0. AALTONEN 14M is not included.

⁴ Based on 9.45 fb^{-1} of data, using neural networks to separate signal from backgrounds. The result is for $m_t = 172.5 \text{ GeV}$. Combination of this result with the CDF measurement in the 1 lepton channel AALTONEN 14L gives $1.36^{+0.37}_{-0.32} \text{ pb}$, consistent with the SM prediction, and is 4.2 sigma away from the background only hypothesis.

⁵ Based on 9.4 fb^{-1} of data, using neural networks to separate signal from backgrounds. The result is for $m_t = 172.5 \text{ GeV}$. The result is 3.8 sigma away from the background only hypothesis.

⁶ Based on 9.7 fb^{-1} of data per experiment. The result is for $m_t = 172.5 \text{ GeV}$, and is a combination of the CDF measurements AALTONEN 14L, AALTONEN 14K and the D0 measurement ABAZOV 13o on the s -channel single t -quark production cross section. The result is consistent with the SM prediction of $1.05 \pm 0.06 \text{ pb}$ and the significance of the observation is of 6.3 standard deviations.

⁷ Based on 7.5 fb^{-1} of data. Neural network is used to discriminate signals (s -, t - and Wt -channel single top production) from backgrounds. The result is consistent with the SM prediction, and gives $|V_{tb}| = 0.95 \pm 0.09$ (stat + syst) ± 0.05 (theory) and $|V_{tb}| > 0.78$ (95% CL). The result is for $m_t = 172.5 \text{ GeV}$.

⁸ Based on 9.7 fb^{-1} of data. Events with $\ell + \cancel{E}_T + 2$ or 3 jets (1 or 2 b -tag) are analysed, assuming $m_t = 172.5 \text{ GeV}$. The combined $s- + t$ -channel cross section gives $|V_{tb}| f_1^L = 1.12^{+0.09}_{-0.08}$, or $|V_{tb}| > 0.92$ at 95% CL for $f_1^L = 1$ and a flat prior within $0 \leq |V_{tb}|^2 \leq 1$.

⁹ Based on 5.4 fb^{-1} of data. The error is statistical + systematic combined. The results are for $m_t = 172.5 \text{ GeV}$. Results for other m_t values are given in Table 2 of ABAZOV 11AA.

¹⁰ Based on 5.4 fb^{-1} of data and for $m_t = 172.5 \text{ GeV}$. The error is statistical + systematic combined. Results for other m_t values are given in Table III of ABAZOV 11AD. The result is obtained by assuming the SM ratio between $t\bar{b}$ (s -channel) and $tq\bar{b}$ (t -channel) productions, and gives $|V_{tb}| f_1^L = 1.02^{+0.10}_{-0.11}$, or $|V_{tb}| > 0.79$ at 95% CL for a flat prior within $0 < |V_{tb}|^2 < 1$.

¹¹ Based on 3.2 fb^{-1} of data. For combined $s- + t$ -channel result see AALTONEN 09AT.

¹² Result is based on 2.1 fb^{-1} of data. Events with large missing E_T and jets with at least one b -jet without identified electron or muon are selected. Result is obtained when observed 2.1σ excess over the background originates from the signal for $m_t = 175 \text{ GeV}$, giving $|V_{tb}| = 1.24^{+0.34}_{-0.29} \pm 0.07$ (theory).

¹³ Result is based on 2.3 fb^{-1} of data. Events with isolated $\ell + \cancel{E}_T + 2, 3, 4$ jets with one or two b -tags are selected. The analysis assumes $m_t = 170 \text{ GeV}$.

¹⁴ Result is based on 4.8 fb^{-1} of data. Events with an isolated reconstructed tau lepton, missing $E_T + 2, 3$ jets with one or two b -tags are selected. When combined with ABAZOV 09Z result for $e + \mu$ channels, the s - and t -channels combined cross section is $3.84^{+0.89}_{-0.83} \text{ pb}$.

¹⁵ Based on 3.2 fb^{-1} of data. Events with isolated $\ell + \cancel{E}_T + \text{jets}$ with at least one b -tag are analyzed and s - and t -channel single top events are selected by using the likelihood function, matrix element, neural-network, boosted decision tree, likelihood function optimized for s -channel process, and neural-network based analysis of events with \cancel{E}_T that has sensitivity for $W \rightarrow \tau\nu$ decays. The result is for $m_t = 175 \text{ GeV}$, and the mean value decreases by 0.02 pb/GeV for smaller m_t . The signal has 5.0 sigma significance. The result gives $|V_{tb}| = 0.91 \pm 0.11$ (stat+syst) ± 0.07 (theory), or $|V_{tb}| > 0.71$ at 95% CL.

¹⁶ Based on 2.3 fb^{-1} of data. Events with isolated $\ell + \cancel{E}_T + \geq 2$ jets with 1 or 2 b -tags are analyzed and s - and t -channel single top events are selected by using boosted decision tree, Bayesian neural networks and the matrix element method. The signal has 5.0 sigma significance. The result gives $|V_{tb}| = 1.07 \pm 0.12$, or $|V_{tb}| > 0.78$ at 95% CL. The analysis assumes $m_t = 170 \text{ GeV}$.

¹⁷ Result is based on 2.2 fb^{-1} of data. Events with isolated $\ell + \cancel{E}_T + 2, 3$ jets with at least one b -tag are selected, and s - and t -channel single top events are selected by using likelihood, matrix element, and neural network discriminants. The result can be interpreted as $|V_{tb}| = 0.88^{+0.13}_{-0.12}$ (stat + syst) ± 0.07 (theory), and $|V_{tb}| > 0.66$ (95% CL) under the $|V_{tb}| < 1$ constraint.

¹⁸ Result is based on 0.9 fb^{-1} of data. Events with isolated $\ell + \cancel{E}_T + 2, 3, 4$ jets with one or two b -vertex-tag are selected, and contributions from $W + \text{jets}$, $t\bar{t}$, s - and t -channel single top events are identified by using boosted decision trees, Bayesian neural networks, and matrix element analysis. The result can be interpreted as the measurement of the CKM matrix element $|V_{tb}| = 1.31^{+0.25}_{-0.21}$, or $|V_{tb}| > 0.68$ (95% CL) under the $|V_{tb}| < 1$ constraint.

¹⁹ Result is based on 0.9 fb^{-1} of data. This result constrains V_{tb} to $0.68 < |V_{tb}| \leq 1$ at 95% CL.

²⁰ ABAZOV 05P bounds single top-quark production from either the s -channel W -exchange process, $q'\bar{q}' \rightarrow t\bar{b}$, or the t -channel W -exchange process, $q'g \rightarrow qt\bar{b}$, based on $\sim 230 \text{ pb}^{-1}$ of data.

²¹ ACOSTA 05N bounds single top-quark production from the t -channel W -exchange process ($q'g \rightarrow qt\bar{b}$), the s -channel W -exchange process ($q'\bar{q}' \rightarrow t\bar{b}$), and from the combined cross section of t - and s -channel. Based on $\sim 162 \text{ pb}^{-1}$ of data.

t -channel Single t Production Cross Section in pp Collisions at $\sqrt{s} = 7 \text{ TeV}$

Direct probe of the $t\bar{b}W$ coupling and possible new physics at $\sqrt{s} = 7 \text{ TeV}$.

¹ AABOUD 19R based on 1.17 to 5.1 fb^{-1} of data from ATLAS and CMS at 7 TeV.

² Based on 4.59 fb^{-1} of data, using neural networks for signal and background separation. $\sigma(tq) = 46 \pm 1 \pm 6 \text{ pb}$ and $\sigma(t\bar{q}) = 23 \pm 1 \pm 3 \text{ pb}$ are separately measured, as well as their ratio $R = \sigma(tq)/\sigma(t\bar{q}) = 2.04 \pm 0.13 \pm 0.12$. The results are for $m_t = 172.5 \text{ GeV}$, and those for other m_t values are given by eq.(4) and Table IV. The measurements give $|V_{tb}| = 1.02 \pm 0.07$ or $|V_{tb}| > 0.88$ (95% CL).

³ Based on 1.04 fb^{-1} of data. The result gives $|V_{tb}| = 1.13^{+0.14}_{-0.13}$ from the ratio $\sigma(\text{exp})/\sigma(\text{th})$, where $\sigma(\text{th})$ is the SM prediction for $|V_{tb}| = 1$. The 95% CL lower bound of $|V_{tb}| > 0.75$ is found if $|V_{tb}| < 1$ is assumed. $\sigma(t) = 59^{+18}_{-16} \text{ pb}$ and $\sigma(\bar{t}) = 33^{+13}_{-12} \text{ pb}$ are found for the separate single t and \bar{t} production cross sections, respectively. The results assume $m_t = 172.5 \text{ GeV}$ for the acceptance.

Quark Particle Listings

 t

⁴ Based on 1.17 fb^{-1} of data for $\ell = \mu$, 1.56 fb^{-1} of data for $\ell = e$ at 7 TeV collected during 2011. The result gives $|V_{tb}| = 1.020 \pm 0.046(\text{meas}) \pm 0.017(\text{th})$. The 95% CL lower bound of $|V_{tb}| > 0.92$ is found if $|V_{tb}| < 1$ is assumed. The results assume $m_t = 172.5 \text{ GeV}$ for the acceptance.

⁵ Based on 36 pb^{-1} of data. The first error is statistical + systematic combined, the second is luminosity. The result gives $|V_{tb}| = 1.114 \pm 0.22(\text{exp}) \pm 0.02(\text{th})$ from the ratio $\sigma(\text{exp})/\sigma(\text{th})$, where $\sigma(\text{th})$ is the SM prediction for $|V_{tb}| = 1$. The 95% CL lower bound of $|V_{tb}| > 0.62$ (0.68) is found from the 2D (BDT) analysis under the constraint $0 < |V_{tb}|^2 < 1$.

t-channel Single t Production Cross Section in pp Collisions at $\sqrt{s} = 8 \text{ TeV}$

VALUE (pb)	DOCUMENT ID	TECN	COMMENT
• • •			We do not use the following data for averages, fits, limits, etc. • • •
87.7 ± 5.8	¹ AABOUD	19R LHC	combination of ATLAS+CMS
$89.6^{+7.1}_{-6.3}$	² AABOUD	17T ATLS	$\ell + \cancel{E}_T + 2j$ (1b j)
$83.6 \pm 2.3 \pm 7.4$	³ KHACHATRYAN...14F	CMS	$\ell + \cancel{E}_T + \geq 2j$ (1, 2 b, 1 forward j)

¹ AABOUD 19R based on 12.2 to 20.3 fb^{-1} of data from ATLAS and CMS at 8 TeV.

² AABOUD 17T based on 20.2 fb^{-1} of data. A maximum-likelihood fit to neural-network discriminant distributions is used to separate signal and background events. Individual cross sections are measured as $\sigma(tq) = 56.7^{+4.3}_{-3.8} \text{ pb}$ and $\sigma(\bar{t}q) = 32.9^{+3.0}_{-2.7} \text{ pb}$, while their ratio is given by $\sigma(tq)/\sigma(\bar{t}q) = 1.72 \pm 0.09$. A lower limit $|V_{tb}| > 0.92$ (95% CL) is obtained. Measured total and differential cross sections are described well by the SM.

³ Based on 19.7 fb^{-1} of data. The t and \bar{t} production cross sections are measured separately as $\sigma_{t\text{-ch.}}(t) = 53.8 \pm 1.5 \pm 4.4 \text{ pb}$ and $\sigma_{t\text{-ch.}}(\bar{t}) = 27.6 \pm 1.3 \pm 3.7 \text{ pb}$, respectively, as well as their ratio $R_{t\text{-ch.}} = \sigma_{t\text{-ch.}}(t)/\sigma_{t\text{-ch.}}(\bar{t}) = 1.95 \pm 0.10 \pm 0.19$, in agreement with the SM predictions. Combination with a previous CMS result at $\sqrt{s} = 7 \text{ TeV}$ [CHATRCHYAN 12Bq] gives $|V_{tb}| = 0.998 \pm 0.038 \pm 0.016$. Also obtained is the ratio $R_{8/7} = \sigma_{t\text{-ch.}}(8\text{TeV})/\sigma_{t\text{-ch.}}(7\text{TeV}) = 1.24 \pm 0.08 \pm 0.12$.

s-channel Single t Production Cross Section in pp Collisions at $\sqrt{s} = 8 \text{ TeV}$

1 ABAZOV 16F based on 9.7 fb^{-1} of data. The result is for $m_t = 172.5\text{ GeV}$, and the m_t dependence is shown in Table V and Fig. 9. The result agrees with the NNLO+NNLL SM prediction of $7.35^{+0.23}_{-0.27}\text{ pb}$.

2 Based on 9 fb^{-1} of data. The measurement is in the channel $t\bar{t} \rightarrow (b\bar{b})\ell(\nu\tau)$, where τ decays into hadrons (τ_h), and ℓ (e or μ) include ℓ from τ decays (τ_ℓ). The result is for $m_t = 173\text{ GeV}$.

3 Based on 8.8 fb^{-1} of data. Combination of CDF and D0 measurements given, respectively, by $\sigma(t\bar{t}; \text{CDF}) = 7.63 \pm 0.31 \pm 0.36 \pm 0.16\text{ pb}$, $\sigma(t\bar{t}; \text{D0}) = 7.56 \pm 0.20 \pm 0.32 \pm 0.46\text{ pb}$. All the results are for $m_t = 172.5\text{ GeV}$. The m_t dependence of the mean value is parametrized in eq. (1) and shown in Fig. 2.

4 Based on 9.7 fb^{-1} of data. Differential cross sections with respect to $m_{t\bar{t}}$, $|y(\text{top})|$, $E_T(\text{top})$ are shown in Figs. 9, 10, 11, respectively, and are compared to the predictions of MC models.

5 Based on 8.8 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96\text{ TeV}$.

6 Based on 8.7 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96\text{ TeV}$. Measure the $t\bar{t}$ cross section simultaneously with the fraction of $t \rightarrow Wb$ decays. The correlation coefficient between those two measurements is -0.434 . Assume unitarity of the 3×3 CKM matrix and set $|V_{tb}| > 0.89$ at 95% CL.

7 Based on 2.2 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV . The result assumes the acceptance for $m_t = 172.5\text{ GeV}$.

8 Based on 1.12 fb^{-1} and assumes $m_t = 175\text{ GeV}$, where the cross section changes by $\pm 0.1\text{ pb}$ for every $\mp 1\text{ GeV}$ shift in m_t . AALTONEN 11D fits simultaneously the $t\bar{t}$

production cross section and the b -tagging efficiency and find improvements in both measurements.

9 Based on 2.7 fb^{-1} . The first error is from statistics and systematics, the second is from luminosity. The result is for $m_t = 175\text{ GeV}$. AALTONEN 11W fits simultaneously a jet flavor discriminator between b -, c -, and light-quarks, and find significant reduction in the systematic error.

10 Based on 2.2 fb^{-1} . The result is for $m_t = 172.5\text{ GeV}$. AALTONEN 11Y selects multi-jet events with large \cancel{E}_T , and vetoes identified electrons and muons.

11 Based on 5.3 fb^{-1} . The error is statistical + systematic + luminosity combined. The result is for $m_t = 172.5\text{ GeV}$. The results for other m_t values are given in Table XII and eq.(10) of ABAZOV 11E.

12 Combination of a dilepton measurement presented in ABAZOV 11Z (based on 5.4 fb^{-1}), which yields $7.36^{+0.90}_{-0.79}$ (stat+syst) pb, and the lepton + jets measurement of ABAZOV 11E. The result is for $m_t = 172.5\text{ GeV}$. The results for other m_t values is given by eq.(5) of ABAZOV 11A.

13 Based on 2.8 fb^{-1} . The result is for $m_t = 175\text{ GeV}$.

14 Based on 2.9 fb^{-1} . Result is obtained from the fraction of signal events in the top quark mass measurement in the all hadronic decay channel.

15 Based on 1.7 fb^{-1} . The result is for $m_t = 175\text{ GeV}$. AALTONEN 10V uses soft electrons from b -hadron decays to suppress W +jets background events.

16 Based on 4.6 fb^{-1} . The result is for $m_t = 172.5\text{ GeV}$. The ratio $\sigma(t\bar{t} \rightarrow \ell + \text{jets}) / \sigma(Z/\gamma^* \rightarrow \ell\ell)$ is measured and then multiplied by the theoretical $Z/\gamma^* \rightarrow \ell\ell$ cross section of $\sigma(Z/\gamma^* \rightarrow \ell\ell) = 251.3 \pm 5.0\text{ pb}$, which is free from the luminosity error.

17 Based on 1 fb^{-1} . The result is for $m_t = 175\text{ GeV}$. $7.9 \pm 2.3\text{ pb}$ is found for $m_t = 170\text{ GeV}$. ABAZOV 10I uses a likelihood discriminant to separate signal from background, where the background model was created from lower jet-multiplicity data.

18 Based on 1 fb^{-1} . The result is for $m_t = 170\text{ GeV}$. For $m_t = 175\text{ GeV}$, the result is $6.3^{+1.2}_{-1.1}(\text{stat}) \pm 0.7(\text{syst}) \pm 0.4(\text{lumi})\text{ pb}$. Cross section of $t\bar{t}$ production has been measured in the $t\bar{t} \rightarrow \tau_h + \text{jets}$ topology, where τ_h denotes hadronically decaying τ leptons. The result for the cross section times the branching ratio is $\sigma(t\bar{t} \rightarrow \tau_h + \text{jets}) = 0.60^{+0.23+0.15}_{-0.22-0.14} \pm 0.04\text{ pb}$ for $m_t = 170\text{ GeV}$.

19 Based on 1.1 fb^{-1} . The result is for $B(W \rightarrow \ell\nu) = 10.8\%$ and $m_t = 175\text{ GeV}$; the mean value is 9.8 for $m_t = 172.5\text{ GeV}$ and 10.1 for $m_t = 170\text{ GeV}$. AALTONEN 09AD used high p_T e or μ with an isolated track to select $t\bar{t}$ decays into dileptons including $\ell = \tau$. The result is based on the candidate event samples with and without vertex $b\text{-tag}$.

20 Based on 2 fb^{-1} . The result is for $m_t = 175\text{ GeV}$; the mean value is 3% higher for $m_t = 170\text{ GeV}$ and 4% lower for $m_t = 180\text{ GeV}$.

21 Result is based on 1 fb^{-1} of data. The result is for $m_t = 170\text{ GeV}$, and the mean value decreases with increasing m_t ; see their Fig. 2. The result is obtained after combining $\ell + \text{jets}$, $\ell\ell$, and $\ell\tau$ final states, and the ratios of the extracted cross sections are $R^{\ell\ell/\ell j} = 0.86^{+0.19}_{-0.17}$ and $R^{\ell\tau/\ell\ell - \ell j} = 0.97^{+0.32}_{-0.29}$, consistent with the SM expectation of $R = 1$. This leads to the upper bound of $B(t \rightarrow bH^+)$ as a function of m_{H^+} . Results are shown in their Fig. 1 for $B(H^+ \rightarrow \tau\nu) = 1$ and $B(H^+ \rightarrow c\bar{s}) = 1$ cases. Comparison of the m_t dependence of the extracted cross section and a partial NNLO prediction gives $m_t = 169.1^{+5.9}_{-5.2}\text{ GeV}$.

22 Result is based on 1 fb^{-1} of data. The result is for $m_t = 170\text{ GeV}$, and the mean value changes by $-0.07 [m_t(\text{GeV}) - 170]\text{ pb}$ near the reference m_t value. Comparison of the m_t dependence of the extracted cross section and a partial NNLO QCD prediction gives $m_t = 171.5^{+9.9}_{-8.8}\text{ GeV}$. The $\ell\tau$ channel alone gives $7.6^{+4.9+3.5+1.4}_{-4.3-3.4-0.9}\text{ pb}$ and the $\ell\ell$ channel gives $7.5^{+1.2+0.7+0.7}_{-1.1-0.6-0.5}\text{ pb}$.

23 Result is based on 0.9 fb^{-1} of data. The first error is from stat + syst, while the latter error is from luminosity. The result is for $m_t = 175\text{ GeV}$, and the mean value changes by $-0.09\text{ pb} \cdot [m_t(\text{GeV}) - 175]$.

24 Result is based on 0.9 fb^{-1} of data. The cross section is obtained from the $\ell + \geq 3\text{ jet}$ event rates with 1 or 2 $b\text{-tag}$, and also from the kinematical likelihood analysis of the $\ell + 3, 4\text{ jet}$ events. The result is for $m_t = 172.6\text{ GeV}$, and its m_t dependence shown in Fig. 3 leads to the constraint $m_t = 170 \pm 7\text{ GeV}$ when compared to the SM prediction.

25 Result is based on 360 pb^{-1} of data. Events with high p_T oppositely charged dileptons $\ell^+ \ell^-$ ($\ell = e, \mu$) are used to obtain cross sections for $t\bar{t}$, W^+W^- , and $Z \rightarrow \tau^+\tau^-$ production processes simultaneously. The other cross sections are given in Table IV.

26 Based on 1.02 fb^{-1} of data. Result is for $m_t = 175\text{ GeV}$. Secondary vertex $b\text{-tag}$ and neural network selections are used to achieve a signal-to-background ratio of about 1/2.

27 Based on 425 pb^{-1} of data. Result is for $m_t = 175\text{ GeV}$. For $m_t = 170.9\text{ GeV}$, $7.8 \pm 1.8(\text{stat} + \text{syst})\text{ pb}$ is obtained.

28 Based on $405 \pm 25\text{ pb}^{-1}$ of data. Result is for $m_t = 175\text{ GeV}$. The last error is for luminosity. Secondary vertex $b\text{-tag}$ and neural network are used to separate the signal events from the background.

29 Based on 425 pb^{-1} of data. Assumes $m_t = 175\text{ GeV}$.

30 Based on $\sim 425\text{ pb}^{-1}$. Assuming $m_t = 175\text{ GeV}$. The first error is combined statistical and systematic, the second one is luminosity.

31 Based on $\sim 318\text{ pb}^{-1}$. Assuming $m_t = 178\text{ GeV}$. The cross section changes by $\pm 0.08\text{ pb}$ for each $\mp 1\text{ GeV}$ change in the assumed m_t . Result is for at least one $b\text{-tag}$. For at least two $b\text{-tagged}$ jets, $t\bar{t}$ signal of significance greater than 5σ is found, and the cross section is $10.1^{+1.6+2.0}_{-1.4-1.3}\text{ pb}$ for $m_t = 178\text{ GeV}$.

32 Based on $\sim 311\text{ pb}^{-1}$. Assuming $m_t = 178\text{ GeV}$. For $m_t = 175\text{ GeV}$, the result is $6.0 \pm 1.2^{+0.9}_{-0.7}$. This is the first CDF measurement without lepton identification, and hence it has sensitivity to the $W \rightarrow \tau\nu$ mode.

33 ABULENCIA,A 06E measures the $t\bar{t}$ production cross section in the all hadronic decay mode by selecting events with 6 to 8 jets and at least one $b\text{-jet}$. $S/B = 1/5$ has been achieved. Based on 311 pb^{-1} . Assuming $m_t = 178\text{ GeV}$.

34 Based on $\sim 318\text{ pb}^{-1}$. Assuming $m_t = 178\text{ GeV}$. Result is for at least one $b\text{-tag}$. For at least two $b\text{-tagged}$ jets, the cross section is $11.1^{+2.3+2.5}_{-1.9-1.9}\text{ pb}$.

35 ABAZOV 05Q measures the top-quark pair production cross section with $\sim 230\text{ pb}^{-1}$ of data, based on the analysis of W plus $n\text{-jet}$ events where W decays into e or μ plus neutrino, and at least one of the jets is $b\text{-jet}$ like. The first error is statistical and systematic, and the second accounts for the luminosity uncertainty. The result assumes

Quark Particle Listings

t

$m_t = 175$ GeV; the mean value changes by $(175 - m_t(\text{GeV})) \times 0.06$ pb in the mass range 160 to 190 GeV.

³⁶ABAZOV 05R measures the top-quark pair production cross section with 224–243 pb⁻¹ of data, based on the analysis of events with two charged leptons in the final state. The result assumes $m_t = 175$ GeV; the mean value changes by $(175 - m_t(\text{GeV})) \times 0.08$ pb in the mass range 160 to 190 GeV.

³⁷Based on 230 pb⁻¹. Assuming $m_t = 175$ GeV.

³⁸Based on 194 pb⁻¹. Assuming $m_t = 175$ GeV.

³⁹Based on 194 ± 11 pb⁻¹. Assuming $m_t = 175$ GeV.

⁴⁰Based on 162 ± 10 pb⁻¹. Assuming $m_t = 175$ GeV.

⁴¹ACOSTA 05V measures the top-quark pair production cross section with ~ 162 pb⁻¹ data, based on the analysis of *W* plus *n*-jet events where *W* decays into *e* or μ plus neutrino, and at least one of the jets is *b*-jet like. Assumes $m_t = 175$ GeV.

⁴²ACOSTA 04I measures the top-quark pair production cross section with 197 ± 12 pb⁻¹ data, based on the analysis of events with two charged leptons in the final state. Assumes $m_t = 175$ GeV.

Ratio of the Production Cross Sections of $t\bar{t}\gamma$ to $t\bar{t}$ at $\sqrt{s} = 1.96$ TeV

VALUE	DOCUMENT ID	TECN	COMMENT
0.024 ± 0.009	¹ AALTONEN	11z CDF	$E_{T(\gamma)} > 10$ GeV, $ \eta(\gamma) < 1.0$

¹Based on 6.0 fb⁻¹ of data. The error is statistical and systematic combined. Events with lepton + $\cancel{E}_T + \geq 3$ jets ($\geq 1b$) with and without central, high E_T photon are measured. The result is consistent with the SM prediction of 0.024 ± 0.005. The absolute production cross section is measured to be 0.18 ± 0.08 fb. The statistical significance is 3.0 standard deviations.

t *t* Production Cross Section in *pp* Collisions at $\sqrt{s} = 7$ TeV

VALUE (pb)	CL%	DOCUMENT ID	TECN	COMMENT
< 1.7	95	¹ AAD	12BE ATLS	$\ell^+ \ell^+ + \cancel{E}_T + \geq 2j + HT$

¹Based on 1.04 fb⁻¹ of *pp* data at $\sqrt{s} = 7$ TeV. The upper bounds are the same for LL, LR and RR chiral components of the two top quarks.

$t\bar{t}$ Production Cross Section in *pp* Collisions at $\sqrt{s} = 5.02$ TeV

Unless otherwise noted the first quoted error is from statistics, the second from systematic uncertainties, and the third from luminosity. If only two errors are quoted the luminosity is included in the systematic uncertainties.

194 ± 72 ± 24 ± 21	²¹ KHACHATRYAN...11A	CMS	$\ell\ell + \cancel{E}_T + \geq 2$ jets

¹KHACHATRYAN 17B based on 5.0 fb⁻¹ of data, using a binned likelihood fit of templates to the data. Also the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.43 \pm 0.04 \pm 0.07 \pm 0.05$ is reported. The results are in agreement with NNLO SM predictions.

²KHACHATRYAN 16AW based on 5.0 fb⁻¹ of data, using a binned likelihood fit to differential distributions of *b*-tagged and non-*b*-tagged jets. The result is in good agreement with NNLO SM predictions.

³Based on 4.6 fb⁻¹ of data. Uses a template fit to distributions of \cancel{E}_T and jet multiplicities to measure simultaneously $t\bar{t}$, *WW*, and $Z/\gamma^* \rightarrow \tau\tau$ cross sections, assuming $m_t = 172.5$ GeV.

⁴AAD 15CC based on 4.6 fb⁻¹ of data. The event selection criteria are optimized for the $\ell\tau_h + \text{jets}$ channel. Using only this channel 183 ± 9 ± 23 ± 3 pb is derived for the cross section.

⁵AAIJ 15R, based on 1.0 fb⁻¹ of data, reports 0.239 ± 0.053 ± 0.033 ± 0.024 pb cross section for the forward fiducial region $p_T(\mu) > 25$ GeV, $2.0 < \eta(\mu) < 4.5$, $50 \text{ GeV} < p_T(b) < 100$ GeV, $2.2 < \eta(b) < 4.2$, $\Delta R(\mu, b) > 0.5$, and $p_T(\mu + b) > 20$ GeV. The three errors are from statistics, systematics, and theory. The result agrees with the SM NLO prediction.

⁶AAD 14AY reports 182.9 ± 3.1 ± 4.2 ± 3.6 ± 3.3 pb value based on 4.6 fb⁻¹ of data. The four errors are from statistics, systematic, luminosity, and the 0.66% beam energy uncertainty. We have combined the systematic uncertainties in quadrature. The result is for $m_t = 172.5$ GeV; for other m_t , $\sigma(m_t) = \sigma(172.5 \text{ GeV}) \times [1 - 0.0028 \times (m_t - 172.5 \text{ GeV})]$. The result is consistent with the SM prediction at NNLO.

⁷Based on 1.67 fb⁻¹ of data. The result uses the acceptance for $m_t = 172.5$ GeV.

⁸Based on 3.54 fb⁻¹ of data.

⁹Based on 2.3 fb⁻¹ of data.

¹⁰Based on 3.9 fb⁻¹ of data.

¹¹Based on 35 pb⁻¹ of data for an assumed top quark mass of $m_t = 172.5$ GeV.

¹²Based on 0.70 fb⁻¹ of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5$ GeV.

¹³Based on 35 pb⁻¹ of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5$ GeV and $173 \pm 17^{+18}_{-16} \pm 6$ pb is found without the *b*-tag.

¹⁴Based on 2.05 fb⁻¹ of data. The hadronic τ candidates are selected using a BDT technique. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5$ GeV.

¹⁵Based on 2.0 fb⁻¹ and 2.2 fb⁻¹ of data for $\ell = e$ and $\ell = \mu$, respectively. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5$ GeV.

¹⁶Based on 2.3 fb⁻¹ of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the profile likelihood-ratio (PLB) method and an assumed m_t of 172.5 GeV.

¹⁷Based on 2.9 pb⁻¹ of data. The result for single lepton channels is $142 \pm 34^{+50}_{-31}$ pb, while for the dilepton channels is $151 \pm 78^{+37}_{-62} \pm 24$ pb.

¹⁸Result is based on 36 pb⁻¹ of data. The first uncertainty corresponds to the statistical and systematic uncertainties, and the second corresponds to the luminosity.

¹⁹Based on 36 pb⁻¹ of data. The ratio of $t\bar{t}$ and Z/γ^* cross sections is measured as $\sigma(pp \rightarrow t\bar{t})/\sigma(pp \rightarrow Z/\gamma^* \rightarrow e^+e^-/\mu^+\mu^-) = 0.175 \pm 0.018(\text{stat}) \pm 0.015(\text{syst})$ for $60 < m_{\ell\ell} < 120$ GeV, for which they use an NNLO prediction for the denominator cross section of 972 ± 42 pb.

²⁰Result is based on 36 pb⁻¹ of data. The first error is from statistical and systematic uncertainties, and the second from luminosity. This is a combination of a measurement in the dilepton channel (CHATRCHYAN 11F) and the measurement in the $\ell + \text{jets}$ channel (CHATRCHYAN 11Z) which yields 150 ± 9 ± 17 ± 6 pb.

²¹Result is based on 3.1 ± 0.3 pb⁻¹ of data.

$t\bar{t}$ Production Cross Section in *pp* Collisions at $\sqrt{s} = 8$ TeV

Unless otherwise noted the first quoted error is from statistics, the second from systematic uncertainties, and the third from luminosity. If only two errors are quoted the luminosity is included in the systematic uncertainties.

¹AABOUD 18BH based on 20.2 fb⁻¹ of data. The result is for $m_t = 172.5$ GeV. To reduce effects of uncertainties in the jet energy scale and *b*-tagging efficiency, they are included as nuisance parameters in the fit of discriminant distributions, after separating selected events into three regions. Furthermore the *W*+jets background distribution is modelled using *Z*+jets event data.

²AABOUD 17Z based on 20.2 fb⁻¹ of data, using the mode $t\bar{t} \rightarrow \tau\nu q'\bar{q}b\bar{b}$ with τ decaying hadronically. Single prong and 3 prong decays of τ are separately analyzed. The result is consistent with the SM. The third quoted uncertainty is due to luminosity.

³KHACHATRYAN 17B based on 19.6 fb⁻¹ of data, using a binned likelihood fit of templates to the data. Also the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.43 \pm 0.04 \pm 0.07 \pm 0.05$ is reported. The results are in agreement with NNLO SM predictions.

⁴AAD 16BK is an update of the value from AAD 14AY using the improved luminosity calibration. The value 242.9 ± 1.7 ± 5.5 ± 5.1 ± 4.2 pb is reported, where we have combined the systematic uncertainties in quadrature. Also the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.328 \pm 0.024 \pm 0.015 \pm 0.038 \pm 0.001$ has been updated. The former result is consistent with the SM predictions at NNLO, while the latter result is 2.1 σ below the expectation.

⁵KHACHATRYAN 16AW based on 19.7 fb⁻¹ of data, using a binned likelihood fit to differential distributions of *b*-tagged and non-*b*-tagged jets. The result is in good agreement with NNLO SM predictions.

⁶KHACHATRYAN 16BC based on 18.4 fb⁻¹ of data. The last uncertainty is due to luminosity. Cuts on kinematical fit probability and $\Delta R(b, b)$ are imposed. The major QCD background is determined from the data. The result is for $m_t = 172.5$ GeV and in agreement with the SM prediction. The top quark p_T spectra, also measured, are significantly softer than theoretical predictions.

⁷AAD 15BP based on 20.3 fb⁻¹ of data. The result is for $m_t = 172.5$ GeV and in agreement with the SM prediction 253⁺¹³₋₁₅ pb at NNLO+NNLL. Superseded by AABOUD 18BH.

- ⁸ AAIJ 15R, based on 2.0 fb⁻¹ of data, reports 0.289 ± 0.043 ± 0.040 ± 0.029 pb cross section for the forward fiducial region $p_T(\mu) > 25$ GeV, $2.0 < \eta(\mu) < 4.5$, 50 GeV < $p_T(b) < 100$ GeV, $2.2 < \eta(b) < 4.2$, $\Delta R(\mu, b) > 0.5$, and $p_T(\mu+b) > 20$ GeV. The three errors are from statistics, systematics, and theory. The result agrees with the SM NLO prediction.
- ⁹ AAD 14AY reports 242.4 ± 1.7 ± 5.5 ± 7.5 ± 4.2 pb value based on 20.3 fb⁻¹ of data. The four errors are from statistics, systematic, luminosity, and the 0.66% beam energy uncertainty. We have combined the systematic uncertainties in quadrature. The result is for $m_t = 172.5$ GeV; for other m_t , $\sigma(m_t) = \sigma(172.5 \text{ GeV}) \times [1 - 0.0028 \times (m_t - 172.5 \text{ GeV})]$. Also measured is the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.326 \pm 0.024 \pm 0.015 \pm 0.049 \pm 0.001$. The results are consistent with the SM predictions at NNLO.
- ¹⁰ Based on 5.3 fb⁻¹ of data. The result is for $m_t = 172.5$ GeV, and a parametrization is given in eq.(6.1) for the mean value at other m_t values. The result is in agreement with the SM prediction 252.9^{+6.4}_{-8.6} pb at NNLO.
- ¹¹ Based on 19.6 fb⁻¹ of data. The measurement is in the channel $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$, where τ decays into hadrons (τ_h). The result is for $m_t = 172.5$ GeV. For $m_t = 173.3$ GeV, the cross section is lower by 3.1 pb.

Quark Particle Listings

t

Fraction of $t\bar{t}$ + multi-jet Events in pp Collisions at $\sqrt{s} = 7$ TeV

VALUE	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.332 ± 0.090	¹ AAD	15D ATLS	$\ell + \cancel{E}_T + n_j$ ($n=3$ to 8)
0.436 ± 0.098	² CHATRCHYAN14AE	CMS	$t\bar{t}(\ell\ell) + 0$ jet ($E_T > 30$ GeV)
0.232 ± 0.125	² CHATRCHYAN14AE	CMS	$t\bar{t}(\ell\ell) + 1$ jet ($E_T > 30$ GeV)
	² CHATRCHYAN14AE	CMS	$t\bar{t}(\ell\ell) + \geq 2$ jet ($E_T > 30$ GeV)

¹ Based on 4.6 fb⁻¹ of data. Fiducial $t\bar{t}$ production cross section is presented as a function of the jet multiplicity for up to eight jets with the jet p_T threshold of 25, 40, 60, and 80 GeV, and as a function of jet p_T up to the 5th jet. MC models can be discriminated by using data for high jet multiplicity and by p_T distributions of the leading and 5th jet.

² Based on 5.0 fb⁻¹ of data. Events with two oppositely charged leptons, large \cancel{E}_T and jets with at least 1 b -tag are used to measure the fraction of $t\bar{t}$ plus additional jets. The gap fraction ($n=0$ jet rate) as a function of the jet p_T and that of H_T , the scalar sum of the p_T 's of additional jets, is shown in Fig. 8.

$t\bar{t}$ Charge Asymmetry (A_C) in pp Collisions at $\sqrt{s} = 7$ TeV

$A_C = (N(\Delta|y| > 0) - N(\Delta|y| < 0)) / (N(\Delta|y| > 0) + N(\Delta|y| < 0))$ where $\Delta|y| = |y_t| - |y_{\bar{t}}|$ is the difference between the absolute values of the top and antitop rapidities and N is the number of events with $\Delta|y|$ positive or negative.

-1.3 ± 2.8 ± 2.9 -3.1	⁷ CHATRCHYAN12Bs	CMS	$\ell + \cancel{E}_T + \geq 4j$ ($\geq 1b$)

¹ ATLAS and CMS combination based on the data of AAD 14I and CHATRCHYAN 12BB. It takes into account the correlations of the measurements and systematic errors. The result is in agreement with the SM prediction (NLO QCD + NLO EW).

² AAD 15AJ based on 4.6 fb⁻¹ of data. After kinematic reconstruction the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. The lepton charge asymmetry is measured as $A_C^\ell = 0.024 \pm 0.015 \pm 0.009$. All the measurements are consistent with the SM predictions.

³ Based on 4.7 fb⁻¹ of data. The result is consistent with the SM prediction of $A_C = 0.0123 \pm 0.0005$. The asymmetry is 0.011 ± 0.018 if restricted to those events where $\beta_Z(t\bar{t}) > 0.6$, which is also consistent with the SM prediction of $0.020^{+0.006}_{-0.007}$.

⁴ Based on 5.0 fb⁻¹ of data. The lepton charge asymmetry is measured as $A_C^\ell = 0.009 \pm 0.0010 \pm 0.006$. A_C^ℓ dependences on $m_{T\bar{T}}$, $|y(t\bar{t})|$, and $p_T(t\bar{t})$ are given in Fig. 5. All measurements are consistent with the SM predictions.

⁵ Based on 1.04 fb⁻¹ of data. The result is consistent with $A_C = 0.006 \pm 0.002$ (MC at NLO). No significant dependence of A_C on $m_{t\bar{t}}$ is observed.

⁶ Based on 5.0 fb⁻¹ of data at 7 TeV.

⁷ Based on 1.09 fb⁻¹ of data. The result is consistent with the SM predictions.

$t\bar{t}$ Charge Asymmetry (A_C) in pp Collisions at $\sqrt{s} = 8$ TeV

¹ ATLAS and CMS combination based on the data of AAD 16AZ and KHACHATRYAN 16AH. It takes into account the correlations of the measurements and systematic errors. A combination of the differential measurements of the charge asymmetry is also presented. The results are in agreement with the SM prediction (NNLO QCD + NLO EW).

² AAD 16AE is based on 20.3 fb⁻¹ of data. After kinematic reconstruction, the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. The lepton charge asymmetry is measured as $A_C^\ell = 0.008 \pm 0.006$. All the measurements are consistent with the SM predictions.

³ AAD 16AZ based on 20.3 fb⁻¹ of data. All the differential and inclusive measurements are statistically limited and consistent with the SM predictions.

⁴ AAD 16T based on 20.3 fb⁻¹ of data. Uses reconstruction techniques for the decay topology of highly boosted top quarks. The observed asymmetry is transformed by unfolding to a parton-level result in the shown fiducial region. The result is consistent with the NLO SM prediction.

⁵ KHACHATRYAN 16AD based on 19.5 fb⁻¹ of data. The lepton charge asymmetry is measured as $A_C^\ell = 0.003 \pm 0.006 \pm 0.003$. All the measurements are consistent with the SM predictions.

⁶ KHACHATRYAN 16AH based on 19.6 fb⁻¹ of data. The same data set as in KHACHATRYAN 16T is used. A template technique is used, which is sensitive to the charge anti-symmetric component of the $t\bar{t}$ rapidity distributions and statistically advantageous. The result is consistent with the SM predictions.

⁷ KHACHATRYAN 16T based on 19.7 fb⁻¹ of data. The same data set as in KHACHATRYAN 16AH is used. After kinematic reconstruction the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. All the measurements are consistent with the SM predictions.

t -quark Polarization in $t\bar{t}$ Events in pp Collisions at $\sqrt{s} = 7$ TeV

The double differential distribution in polar angles, θ_1 (θ_2) of the decay product of the top (anti-top) decay products, is parametrized as $(1/\sigma)d\sigma/(d\cos\theta_1 d\cos\theta_2) = (1/4) (1 + A_t \cos\theta_1 + A_{\bar{t}} \cos\theta_2 - C \cos\theta_1 \cos\theta_2)$. The charged lepton is used to tag t or \bar{t} . The coefficient A_t and $A_{\bar{t}}$ measure the average helicity of t and \bar{t} , respectively. $A_{CPC} = A_t = A_{\bar{t}}$ assumes CP conservation, whereas $A_{CPV} = A_t = -A_{\bar{t}}$ corresponds to maximal CP violation.

¹ AABOUD 17Bb based on 20.2 fb⁻¹ of pp data. Triple-differential decay rate of top quark is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. α_ℓ denotes the spin analyzing power of charged lepton, and the spin axis of the top polarization P is taken along the spectator-quark momentum in the top rest frame. The value is compatible with the SM prediction of about 0.9.

² AABOUD 17I based on 20.2 fb⁻¹ of pp data. A cut-based analysis is used to discriminate between signal and backgrounds. α_ℓ denotes the spin analyzing power of charged lepton, and the spin axis of the top polarization P is taken along the spectator-quark momentum in the top rest frame. See this paper for a number of other asymmetries and measurements that are not included here.

³ AABOUD 17I based on 20.2 fb⁻¹ of pp data. A cut-based analysis is used to discriminate between signal and backgrounds. F_\pm denotes W helicity fraction, and the spin axis of the top polarization P is taken along the spectator-quark momentum in the top rest frame. See this paper for a number of other asymmetries and measurements that are not included here.

⁴ KHACHATRYAN 16B0 based on 19.7 fb⁻¹ of data. A high-purity sample with a muon is selected by a multivariate analysis. The value is the top spin asymmetry, given by one half of the spin analyzing power α_μ ($=1$ at LO of SM) times the top polarization, P , where the spin axis is defined as the direction of the untagged jet in the top rest frame. The value is compatible with the SM prediction of 0.44 with a 2.0 σ deviation.

$g\bar{g} \rightarrow t\bar{t}$ Fraction in $p\bar{p}$ Collisions at $\sqrt{s} = 1.96$ TeV

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •				
<0.33	68	¹ AALTONEN	09F CDF	$t\bar{t}$ correlations
0.07 ± 0.14 ± 0.07		² AALTONEN	08AG CDF	low p_T number of tracks

¹ Based on 955 pb⁻¹. AALTONEN 09F used differences in the $t\bar{t}$ production angular distribution and polarization correlation to discriminate between $g\bar{g} \rightarrow t\bar{t}$ and $q\bar{q} \rightarrow t\bar{t}$ subprocesses. The combination with the result of AALTONEN 08AG yields $0.07^{+0.15}_{-0.07}$.

²Result is based on 0.96 fb^{-1} of data. The contribution of the subprocesses $gg \rightarrow t\bar{t}$ and $q\bar{q} \rightarrow t\bar{t}$ is distinguished by using the difference between quark and gluon initiated jets in the number of small p_T ($0.3 \text{ GeV} < p_T < 3 \text{ GeV}$) charged particles in the central region ($|\eta| < 1.1$).

A_{FB}^{ℓ} of $t\bar{t}$ in $p\bar{p}$ Collisions at $\sqrt{s} = 1.96 \text{ TeV}$

A_{FB}^{ℓ} = Forward-backward asymmetry.

¹AALTONEN 18 based on $9\text{--}10 \text{ fb}^{-1}$ of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. The value is the asymmetry in the number of reconstructed $t\bar{t}$ events with rapidity $y_t > y_{\bar{t}}$ and those with $y_t < y_{\bar{t}}$. The combined fits to CDF and D0 single lepton and $\ell\ell$ asymmetries give $A_{FB}^{\ell} = 0.073 \pm 0.016 \pm 0.012$ and $A_{FB}^{\ell\ell} = 0.108 \pm 0.043 \pm 0.016$, respectively. The results are consistent with the SM predictions.

²ABAZOV 15K based on 9.7 fb^{-1} of data. The result is consistent with the SM predictions. By combining with the previous D0 measurement in the $\ell +$ jet channel ABABOV 14H, $A_{FB}^{\ell} = 0.118 \pm 0.025 \pm 0.013$ is obtained.

³AALTONEN 14F based on 9.1 fb^{-1} of data. A_{FB}^{ℓ} and $A_{FB}^{\ell\ell}$ denote, respectively, the asymmetries $(N(x>0) - N(x<0))/N_{tot}$ for $x = q\ell/q\bar{\ell}$ ($q\ell$ is the charge of ℓ) and $x = \eta_{\ell+} - \eta_{\ell-}$. Both results are consistent with the SM predictions. By combining with the previous CDF measurement in the $\ell +$ jet channel AALTONEN 13X, $A_{FB}^{\ell} = 0.098 \pm 0.028$ is obtained. The combined result is about two sigma larger than the SM prediction of $A_{FB}^{\ell} = 0.038 \pm 0.003$.

⁴Based on 9.7 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. The asymmetry is corrected for the production level for events with $|y_t| < 1.5$. Asymmetry as functions of $E_T(\ell)$ and $|y_t|$ are given in Figs. 7 and 8, respectively. Combination with the asymmetry measured in the dilepton channel [ABAZOV 13P] gives $A_{FB}^{\ell} = 4.2 \pm 2.0 \pm 1.4 \%$, in agreement with the SM prediction of 2.0%.

⁵Based on 9.7 fb^{-1} of data of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. The measured asymmetry is in agreement with the SM predictions of $8.8 \pm 0.9 \%$ [BERNREUTHER 12], which includes the EW effects. The dependences of the asymmetry on $|y(t) - y(\bar{t})|$ and $m_{t\bar{t}}$ are shown in Figs. 9 and 10, respectively.

⁶Based on 9.4 fb^{-1} of data. Reported A_{FB}^{ℓ} values come from the determination of a_j coefficients of $d\sigma/d(\cos\theta_\ell) = \sum_i a_i p_i(\cos\theta_\ell)$ measurement. The result of $a_1/a_0 = (40 \pm 12)\%$ seems higher than the NLO SM prediction of $(15^{+7}_{-3})\%$.

⁷Based on 9.4 fb^{-1} of data. The quoted result is the asymmetry at the parton level.

⁸Based on 9.4 fb^{-1} of data. The observed asymmetry is to be compared with the SM prediction of $A_{FB}^{\ell} = 0.038 \pm 0.003$.

⁹Based on 5.4 fb^{-1} of data. ABABOV 13A studied the dilepton channel of the $t\bar{t}$ events and measured the leptonic forward-backward asymmetry to be $A_{FB}^{\ell} = 5.8 \pm 5.1 \pm 1.3\%$, which is consistent with the SM (QCD+EW) prediction of $4.7 \pm 0.1\%$. The result is obtained after combining the measurement ($15.2 \pm 4.0\%$) in the $\ell +$ jets channel ABABOV 11AH. The top quark helicity is measured by using the neutrino weighting method to be consistent with zero in both dilepton and $\ell +$ jets channels.

¹⁰Based on 5.3 fb^{-1} of data. The error is statistical and systematic combined. Events with lepton $+ E_T + \geq 4$ jets ($\geq 1b$) are used. AALTONEN 11F also measures the asymmetry as a function of the rapidity difference $|y_t - y_{\bar{t}}|$. The NLO QCD predictions [MCFM] are $(4.0 \pm 0.6)\%$ and $(8.8 \pm 1.3)\%$ for $m_{t\bar{t}} < 450$ and $> 450 \text{ GeV}$, respectively.

¹¹Based on 5.4 fb^{-1} of data. The error is statistical and systematic combined. The quoted asymmetry is obtained after unfolding to be compared with the MC@NLO prediction of $(5.0 \pm 0.1)\%$. No significant difference between the $m_{t\bar{t}} < 450$ and $> 450 \text{ GeV}$ data samples is found. A corrected asymmetry based on the lepton from a top quark decay of $(15.2 \pm 4.0)\%$ is measured to be compared to the MC@NLO prediction of $(2.1 \pm 0.1)\%$.

¹²Result is based on 1.9 fb^{-1} of data. The FB asymmetry in the $t\bar{t}$ events has been measured in the $\ell +$ jets mode, where the lepton charge is used as the flavor tag. The asymmetry in the $p\bar{p}$ frame is defined in terms of $\cos(\theta)$ of hadronically decaying t -quark momentum, whereas that in the $t\bar{t}$ frame is defined in terms of the t and \bar{t} rapidity difference. The results are consistent ($\leq 2\sigma$) with the SM predictions.

¹³Result is based on 0.9 fb^{-1} of data. The asymmetry in the number of $t\bar{t}$ events with $y_t > y_{\bar{t}}$ and those with $y_t < y_{\bar{t}}$ has been measured in the lepton $+$ jets final state. The observed value is consistent with the SM prediction of 0.8% by MC@NLO, and an upper bound on the $Z' \rightarrow t\bar{t}$ contribution for the SM Z -like couplings is given in Fig. 2 for $350 \text{ GeV} < m_{Z'} < 1 \text{ TeV}$.

t-Quark Electric Charge

VALUE	DOCUMENT ID	TECN	COMMENT

	⁴ AALTONEN	10s CDF	Repl. by AALTONEN 13J
	⁵ ABAZOV	07c D0	fraction of $ q = 4e/3$ pair

¹AAD 13AY result is based on 2.05 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$, the result is obtained by reconstructing $t\bar{t}$ events in the lepton $+$ jets final state, where b -jet charges are tagged by the jet-charge algorithm. This measurement excludes the charge $-4/3$ assignment to the top quark at more than 8 standard deviations.

²ABAZOV 14D result is based on 5.3 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. The electric charge of $b - W$ system in $t\bar{t}$ candidate events is measured from the charges of the leptons from W decay and in b jets. Under the assumption that the $b - W$ system consists of the sum of the top quark and the charge $-4/3$ quark $b'(-4/3)$ of the same mass, the top quark fraction is found to be $f = 0.88 \pm 0.13$ (stat) ± 0.11 (syst), or the upper bound for the $b'(-4/3)$ contamination of $1 - f < 0.46$ (95% CL).

³AALTONEN 13J excludes the charge $-4/3$ assignment to the top quark at 99% CL, using 5.6 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Result is obtained by reconstructing $t\bar{t}$ events in the lepton $+$ jets final state, where b -jet charges are tagged by the jet-charge algorithm.

⁴AALTONEN 10s excludes the charge $-4/3$ assignment for the top quark [CHANG 99] at 95% CL, using 2.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Result is obtained by reconstructing $t\bar{t}$ events in the lepton $+$ jets final state, where b -jet charges are tagged by the SLT (soft lepton tag) algorithm.

⁵ABAZOV 07c reports an upper limit $\rho < 0.80$ (90% CL) on the fraction ρ of exotic quark pairs $Q\bar{Q}$ with electric charge $|q| = 4e/3$ in $t\bar{t}$ candidate events with high p_T lepton, missing E_T and ≥ 4 jets. The result is obtained by measuring the fraction of events in which the quark pair decays into $W^- + b$ and $W^+ + \bar{b}$, where b and \bar{b} jets are discriminated by using the charge and momenta of tracks within the jet cones. The maximum CL at which the model of CHANG 99 can be excluded is 92%. Based on 370 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.

- SIRUNYAN 19Aq based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair production of vector-like *b'* is searched for with one *b'* decaying into *Zb* and the other *b'* decaying into *Wt*, *Zb*, *hb*. Events with an opposite-sign lepton pair consistent with coming from *Z* and jets are used. Mass limits are obtained for a variety of branching ratios of *b'*.
- SIRUNYAN 19Bw based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like *b'* using all-hadronic final state. The analysis is made for the *Zb*, *Wt*, *hb* modes and mass limits are obtained for a variety of branching ratios.
- AABOUD 18Aw based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like *b'* using lepton-plus-jets final state. The search is also sensitive to the decays into *Zb* and *Hb* final states.
- AABOUD 18Ce based on 36.1 fb⁻¹ of proton-proton data taken at $\sqrt{s} = 13$ TeV. Events including a same-sign lepton pair are used. The limit is for a singlet model, assuming the branching ratios of *b'* into *Zb*, *Wt* and *Hb* as predicted by the model.
- AABOUD 18Cl, AABOUD 18Cp based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like *b'* using all-hadronic final state. The analysis is particularly powerful for the *b' → hb* mode. Assuming the pure decay only in this mode sets a limit $m_{b'} > 1010$ GeV.
- AABOUD 18Cp based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair and single production of vector-like *b'* are searched for with at least one *b'* decaying into *Zb*. In the case of $B(b' \rightarrow Zb) = 1$, the limit is $m_{b'} > 1220$ GeV.
- The limit is for the singlet model, assuming that the branching ratios into *Wt*, *Zb*, *hb* add up to one.
- The limit is for the doublet model, assuming that the branching ratios into *Wt*, *Zb*, *hb* add up to one.
- AABOUD 18Cr based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. A combination of searches for the pair-produced vector-like *b'* in various decay channels (*b' → Wt*, *Zb*, *hb*). Also a model-independent limit is obtained as $m_{b'} > 1.03$ TeV, assuming that the branching ratios into *Zb*, *Wt*, and *hb* add up to one.
- The limit is for the singlet *b'*.
- The limit is for *b'* in a weak isospin doublet (*t'*, *b'*) and $|V_{t'b}| \ll |V_{tb}|$. For a *b'* in a doublet with a charge $-4/3$ vector-like quark, the limit $m_{b'} > 1.14$ TeV is obtained.
- SIRUNYAN 18Bm based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like *b'*. Three channels (single lepton, same-charge 2 leptons, or at least 3 leptons) are considered for various branching fraction combinations. Assuming $B(tW) = 1$, the limit is 1240 GeV and for $B(bZ) = 1$ it is 960 GeV.
- SIRUNYAN 18Q based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The limit is for the pair-produced vector-like *b'* that couple only to light quarks. Upper cross section limits on the single production of a *b'* and constraints for other decay channels (*Zq* and *Hq*) are also given in the paper.
- SIRUNYAN 17Au based on 2.3-2.6 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Limit on pair-produced singlet vector-like *b'* using one lepton and several jets. The mass bound is given for a *b'* transforming as a singlet under the electroweak symmetry group, assumed to decay through *W*, *Z* or Higgs boson (which decays to jets) and to a third generation quark.
- KHACHATRYAN 16An based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced vector-like *b'* using 1, 2, and >2 leptons as well as fully hadronic final states. Other limits depending on the branching fractions to *tW*, *bZ*, and *bH* are given in Table IX.
- AAD 15By based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced vector-like *b'* assuming the branching fractions to *W*, *Z*, and *h* modes of the singlet model. Used events containing $\geq 2\ell + \cancel{E}_T + \geq 2j (\geq 1b)$ and including a same-sign lepton pair.
- AAD 15By based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced chiral *b'*-quark. Used events containing $\geq 2\ell + \cancel{E}_T + \geq 2j (\geq 1b)$ and including a same-sign lepton pair.
- AAD 15z based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used events with $\ell + \cancel{E}_T + \geq 6j (\geq 1b)$ and at least one pair of jets from weak boson decay, primarily designed to select the signature $b'\bar{b}' \rightarrow WW\bar{t}\bar{t} \rightarrow WWWW\bar{b}\bar{b}$. This is a limit on pair-produced vector-like *b'*. The lower mass limit is 640 GeV for a vector-like singlet *b'*.
- Based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. No significant excess over SM expectation is found in the search for pair production or single production of *b'* in the events with dilepton from a high *p*_T *Z* and additional jets ($\geq 1b$ -tag). If instead of $B(b' \rightarrow Wt) = 1$ an electroweak singlet with $B(b' \rightarrow Wt) \sim 0.45$ is assumed, the limit reduces to 685 GeV.
- Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 13i looked for events with one isolated electron or muon, large \cancel{E}_T , and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.
- Result is based on 1.1 fb⁻¹ of data. No signal is found for the search of long-lived particles which decay into final states with two electrons or photons, and upper bound on the cross section times branching fraction is obtained for $2 < c\tau < 7000$ nm; see Fig. 3. 95% CL excluded region of *b'* lifetime and mass is shown in Fig. 4.

Quark Particle Listings

b' (Fourth Generation) Quark

- ²² ACOSTA 03 looked for long-lived fourth generation quarks in the data sample of 90 pb⁻¹ of $\sqrt{s}=1.8$ TeV $p\bar{p}$ collisions by using the muon-like penetration and anomalously high ionization energy loss signature. The corresponding lower mass bound for the charge (2/3)e quark (t') is 220 GeV. The t' bound is higher than the b' bound because t' is more likely to produce charged hadrons than b' . The 95% CL upper bounds for the production cross sections are given in their Fig. 3.
- ²³ AAD 15AR based on 20.3 fb⁻¹ of pp data at $\sqrt{s}=8$ TeV. Used lepton-plus-jets final state. See Fig. 24 for mass limits in the plane of $B(b' \rightarrow Wt)$ vs. $B(b' \rightarrow Hb)$ from $b'\bar{b}' \rightarrow Hb + X$ searches.
- ²⁴ AAD 15CN based on 20.3 fb⁻¹ of pp data at $\sqrt{s}=8$ TeV. Limit on pair-production of chiral b' -quark. Used events with $\ell + E_T + \geq 4j$ (non- b -tagged). Limits on a heavy vector-like quark, which decays into Wq, Zq, hq , are presented in the plane $B(Q \rightarrow Wq)$ vs. $B(Q \rightarrow hq)$ in Fig. 12.
- ²⁵ Based on 1.04 fb⁻¹ of pp data at $\sqrt{s}=7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a t quark in the events with a high p_T isolated lepton, large E_T , and at least 6 jets in which one, two or more dijets are from W .
- ²⁶ Based on 2.0 fb⁻¹ of pp data at $\sqrt{s}=7$ TeV. No $b' \rightarrow Zb$ invariant mass peak is found in the search of heavy quark pair production that decay into Z and a b quark in events with $Z \rightarrow e^+e^-$ and at least one b -jet. The lower mass limit is 358 GeV for a vector-like singlet b' mixing solely with the third SM generation.
- ²⁷ Based on 1.04 fb⁻¹ of pp data at $\sqrt{s}=7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a quark in the events with dileptons, large E_T , and ≥ 2 jets.
- ²⁸ Based on 1.04 fb⁻¹ of pp data at $\sqrt{s}=7$ TeV. AAD 12BE looked for events with two isolated like-sign leptons and at least 2 jets, large E_T and $H_T > 350$ GeV.
- ²⁹ Based on 5 fb⁻¹ of pp data at $\sqrt{s}=7$ TeV. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4th generation quarks that decay to bW or tW . Absence of signal in events with one lepton, same-sign dileptons or tripletons gives the bound. With a mass difference of 25 GeV/c² between $m_{t'}$ and $m_{b'}$, the corresponding limit shifts by about ± 20 GeV/c².
- ³⁰ Based on 4.9 fb⁻¹ of pp data at $\sqrt{s}=7$ TeV. CHATRCHYAN 12X looked for events with tripletons or same-sign dileptons and at least one b jet.
- ³¹ Based on 4.8 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11J looked for events with $\ell + E_T + \geq 5j$ ($\geq 1 b$ or c). No signal is observed and the bound $\sigma(b'\bar{b}') < 30$ fb for $m_{b'} > 375$ GeV is found for $B(b' \rightarrow Wt) = 1$.
- ³² Based on 34 pb⁻¹ of data in pp collisions at 7 TeV. CHATRCHYAN 11L looked for multi-jet events with tripletons or same-sign dileptons. No excess above the SM background excludes $m_{b'}$ between 255 and 361 GeV at 95% CL for $B(b' \rightarrow Wt) = 1$.
- ³³ Based on 2.7 fb⁻¹ of data in $p\bar{p}$ collisions at $\sqrt{s}=1.96$ TeV. AALTONEN 10H looked for pair production of heavy quarks which decay into tW^- or tW^+ , in events with same sign dileptons (e or μ), several jets and large missing E_T . The result is obtained for b' which decays into tW^- . For the charge 5/3 quark ($T_{5/3}$) which decays into tW^+ , $m_{T_{5/3}} > 365$ GeV (95% CL) is found when it has the charge $-1/3$ partner B of the same mass.
- ³⁴ FLACCO 10 result is obtained from AALTONEN 10H result of $m_{b'} > 338$ GeV, by relaxing the condition $B(b' \rightarrow Wt) = 100\%$ when $m_{b'} > m_{t'}$.
- ³⁵ Result is based on 1.06 fb⁻¹ of data. No excess from the SM Z +jet events is found when Z decays into e or $\mu\mu$. The $m_{b'}$ bound is found by comparing the resulting upper bound on $\sigma(b'\bar{b}') [1 - (1 - B(b' \rightarrow Zb))^2]$ and the LO estimate of the b' pair production cross section shown in Fig. 38 of the article.
- ³⁶ HUANG 08 reexamined the b' mass lower bound of 268 GeV obtained in AALTONEN 07c that assumes $B(b' \rightarrow Zb) = 1$, which does not hold for $m_{b'} > 255$ GeV. The lower mass bound is given in the plane of $\sin^2(\theta_{tb'})$ and $m_{b'}$.
- ³⁷ AFFOLDER 00 looked for b' that decays into $b+Z$. The signal searched for is $bbZZ$ events where one Z decays into e^+e^- or $\mu^+\mu^-$ and the other Z decays hadronically. The bound assumes $B(b' \rightarrow Zb) = 100\%$. Between 100 GeV and 199 GeV, the 95%CL upper bound on $\sigma(b' \rightarrow \bar{b}') \times B^2(b' \rightarrow Zb)$ is also given (see their Fig. 2).
- ³⁸ ABE 98n looked for $Z \rightarrow e^+e^-$ decays with displaced vertices. Quoted limit assumes $B(b' \rightarrow Zb) = 1$ and $c\tau_{b'} = 1$ cm. The limit is lower than m_{Z+m_b} (~ 96 GeV) if $c\tau > 22$ cm or $c\tau < 0.009$ cm. See their Fig. 4.
- ³⁹ ABACHI 97D searched for b' that decays mainly via FCNC. They obtained 95%CL upper bounds on $B(b'\bar{b}' \rightarrow \gamma + 3 \text{ jets})$ and $B(b'\bar{b}' \rightarrow 2\gamma + 2 \text{ jets})$, which can be interpreted as the lower mass bound $m_{b'} > m_{Z+m_b}$.
- ⁴⁰ ABACHI 95F bound on the top-quark also applies to b' and t' quarks that decay predominantly into W . See FROGGATT 97.
- ⁴¹ MUKHOPADHYAYA 93 analyze CDF dilepton data of ABE 92g in terms of a new quark decaying via flavor-changing neutral current. The above limit assumes $B(b' \rightarrow b\ell^+\ell^-) = 1\%$. For an exotic quark decaying only via virtual Z [$B(b\ell^+\ell^-) = 3\%$], the limit is 85 GeV.
- ⁴² ABE 92 dilepton analysis limit of >85 GeV at CL=95% also applies to b' quarks, as discussed in ABE 90b.
- ⁴³ ABE 90b exclude the region 28–72 GeV.
- ⁴⁴ AKESSON 90 searched for events having an electron with $p_T > 12$ GeV, missing momentum > 15 GeV, and a jet with $E_T > 10$ GeV, $|\eta| < 2.2$, and excluded $m_{b'}$ between 30 and 69 GeV.
- ⁴⁵ For the reduction of the limit due to non-charged-current decay modes, see Fig. 19 of ALBAJAR 90b.
- ⁴⁶ ALBAJAR 88 study events at $E_{cm} = 546$ and 630 GeV with a muon or isolated electron, accompanied by one or more jets and find agreement with Monte Carlo predictions for the production of charm and bottom, without the need for a new quark. The lower mass limit is obtained by using a conservative estimate for the $b'\bar{b}'$ production cross section and by assuming that it cannot be produced in W decays. The value quoted here is revised using the full $O(\alpha_s^3)$ cross section of ALTARELLI 88.

$b'(-1/3)$ mass limits from single production in $p\bar{p}$ and pp collisions

		⁶ SIRUNYAN	19AI CMS	$bZ/tW \rightarrow b' \rightarrow tW$

- ¹ AAD 16AH based on 20.3 fb⁻¹ of data in pp collisions at 8 TeV. No significant excess over SM expectation is found in the search for a vector-like b' in the single-lepton and dilepton channels (ℓ or $\ell\ell$) + 1,2,3 j ($\geq 1b$). The model assumes that the b' has the excited quark couplings.
- ² Based on 19.7 fb⁻¹ of data in pp collisions at 8 TeV. Limit on left-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.
- ³ Based on 19.7 fb⁻¹ of data in pp collisions at 8 TeV. Limit on right-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.
- ⁴ Based on 19.7 fb⁻¹ of data in pp collisions at 8 TeV. Limit on vector-like b' assuming 100% decay to tW and using all-hadronic, lepton+jets, and dilepton final states.
- ⁵ Based on 5.4 fb⁻¹ of data in $ppbar$ collisions at 1.96 TeV. ABAZOV 11F looked for single production of b' via the W or Z coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes $p\bar{p} \rightarrow b'q \rightarrow Wuq$, and $p\bar{p} \rightarrow b'q \rightarrow Zdq$ are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.
- ⁶ SIRUNYAN 19AI based on 35.9 fb⁻¹ of pp data at $\sqrt{s}=13$ TeV. Exclusion limits are set on the product of the production cross section and branching fraction for the $b'(-1/3) + b$ and $b'(-1/3) + t$ modes as a function of the vector-like quark mass in Figs. 7 and 8 and in Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.

MASS LIMITS for b' (4th Generation) Quark or Hadron in e^+e^- Collisions

Search for hadrons containing a fourth-generation $-1/3$ quark denoted b' .

The last column specifies the assumption for the decay mode (CC denotes the conventional charged-current decay) and the event signature which is looked for.

- ¹ DECAMP 90F looked for isolated charged particles, for isolated photons, and for four-jet final states. The modes $b' \rightarrow bg$ for $B(b' \rightarrow bg) > 65\%$ or $b' \rightarrow b\gamma$ for $B(b' \rightarrow b\gamma) > 5\%$ are excluded. Charged Higgs decay were not discussed.
- ² ABDALLAH 07 searched for b' pair production at $E_{cm}=196\text{--}209$ GeV, with 420 pb⁻¹. No signal leads to the 95% CL upper limits on $B(b' \rightarrow bZ)$ and $B(b' \rightarrow cW)$ for $m_{b'} = 96$ to 103 GeV.
- ³ ADRIANI 93g search for vector quarkonium states near Z and give limit on quarkonium- Z mixing parameter $\delta m^2 < (10\text{--}30)$ GeV² (95%CL) for the mass 88–94.5 GeV. Using

See key on page 999

Quark Particle Listings

 b' (Fourth Generation) Quark, t' (Fourth Generation) Quark

Richardson potential, a $1S$ ($b'\bar{b}'$) state is excluded for the mass range 87.7–94.7 GeV. This range depends on the potential choice.

⁴ ABREU 90d assumed $m_{H^-} < m_{b'}$ – 3 GeV.

⁵ Superseded by ABREU 91f.

⁶ AKRAWY 90b search was restricted to data near the Z peak at $E_{cm} = 91.26$ GeV at LEP. The excluded region is between 23.6 and 41.4 GeV if no H^\pm decays exist. For charged Higgs decays the excluded regions are between ($m_{H^\pm} + 1.5$ GeV) and 45.5 GeV.

⁷ AKRAWY 90j search for isolated photons in hadronic Z decay and derive

$B(Z \rightarrow b'\bar{b}') \cdot B(b' \rightarrow \gamma X) / B(Z \rightarrow \text{hadrons}) < 2.2 \times 10^{-3}$. Mass limit assumes $B(b' \rightarrow \gamma X) > 10\%$.

⁸ ABE 89e search at $E_{cm} = 56\text{--}57$ GeV at TRISTAN for multihadron events with a spherical shape (using thrust and acoplanarity) or containing isolated leptons.

⁹ ABE 89c search was at $E_{cm} = 55\text{--}60.8$ GeV at TRISTAN.

¹⁰ If the photonic decay mode is large ($B(b' \rightarrow b\gamma) > 25\%$), the ABRAMS 89c limit is 45.4 GeV. The limit for Higgs decay ($b' \rightarrow cH^\pm, H^\pm \rightarrow \bar{\nu}s$) is 45.2 GeV.

¹¹ ADACHI 89c search was at $E_{cm} = 56.5\text{--}60.8$ GeV at TRISTAN using multi-hadron events accompanying muons.

¹² ADACHI 89c also gives limits for any mixture of CC and bg decays.

¹³ ENO 89 search at $E_{cm} = 50\text{--}60.8$ GeV at TRISTAN.

¹⁴ ENO 89 considers arbitrary mixture of the charged current, bg , and $b\gamma$ decays.

¹⁵ IGARASHI 88 searches for leptons in low-thrust events and gives $\Delta R(b') < 0.26$ (95% CL) assuming charged current decay, which translates to $m_{b'} > 24.4$ GeV.

¹⁶ SAGAWA 88 set limit $\sigma(\text{top}) < 6.1$ pb at CL=95% for top-flavored hadron production from event shape analyses at $E_{cm} = 52$ GeV. By using the quark parton model cross-section formula near threshold, the above limit leads to lower mass bounds of 23.8 GeV for charge $-1/3$ quarks.

¹⁷ ADEVA 86 give 95%CL upper bound on an excess of the normalized cross section, ΔR , as a function of the minimum c.m. energy (see their figure 3). Production of a pair of $1/3$ charge quarks is excluded up to $E_{cm} = 45.4$ GeV.

¹⁸ ALTHOFF 84c narrow state search sets limit $\Gamma(e^+e^-B)/\text{hadrons} < 2.4$ keV CL = 95% and heavy charge $1/3$ quark pair production $m > 21$ GeV, CL = 95%.

¹⁹ ALTHOFF 84i exclude heavy quark pair production for $7 < m < 19$ GeV ($1/3$ charge) using aplanarity distributions (CL = 95%).

- ¹ SIRUNYAN 19AQ based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13$ TeV. Pair production of vector-like t' is searched for with one t' decaying into Zt and the other t' decaying into Wb, Zt, ht . Events with an opposite-sign lepton pair consistent with coming from Z and jets are used. Mass limits are obtained for a variety of branching ratios of t' .
 - ² SIRUNYAN 19BW based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like t' using all-hadronic final state. The analysis is made for the Wb, Zt, ht modes and mass limits are obtained for a variety of branching ratios.
 - ³ AABOUD 18CE based on 36.1 fb^{-1} of proton-proton data taken at $\sqrt{s} = 13$ TeV. Events including a same-sign lepton pair are used. The limit is for a singlet model, assuming the branching ratios of t' into Zt, Wb and ht as predicted by the model.
 - ⁴ AABOUD 18CL based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like t' using all-hadronic final state. The analysis is also made for the Wb, Zt, ht modes and mass limits are obtained for a variety of branching ratios.
 - ⁵ AABOUD 18CP based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13$ TeV. Pair and single production of vector-like t' are searched for with at least one t' decaying into Zt . In the case of $B(t' \rightarrow Zt) = 1$, the limit is $m_{t'} > 1340$ GeV.
 - ⁶ The limit is for the singlet model, assuming that the branching ratios into Zt, Wb , and ht add up to one.
 - ⁷ The limit is for the doublet model, assuming that the branching ratios into Zt, Wb , and ht add up to one.
 - ⁸ AABOUD 18CR based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13$ TeV. A combination of searches for the pair-produced vector-like t' in various decay channels ($t' \rightarrow Wb, Zt, ht$). Also a model-independent limit is obtained as $m_{t'} > 1.31$ TeV, assuming that the branching ratios into Zt, Wb and ht add up to one.
 - ⁹ The limit is for the singlet t' .
 - ¹⁰ The limit is for t' in a weak isospin doublet (t', b') and $|V_{tb'}| \ll |V_{tb}|$.
 - ¹¹ SIRUNYAN 18BM based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like t' . Three channels (single lepton, same-charge 2 leptons, or at least 3 leptons) are considered for various branching fraction combinations. Assuming $B(t'H) = 1$, the limit is 1270 GeV and for $B(t'Z) = 1$ it is 1300 GeV.
 - ¹² SIRUNYAN 18Q based on 19.7 fb^{-1} of pp data at $\sqrt{s} = 8$ TeV. The limit is for the pair-produced vector-like t' that couple only to light quarks. Constraints for other decay channels (Zq and Hq) are also given in the paper.
 - ¹³ SIRUNYAN 18W based on 35.8 fb^{-1} of pp data at $\sqrt{s} = 13$ TeV. The limit is for the vector-like t' pair-produced by strong interaction using lepton-plus-jets mode and assuming that $B(t' \rightarrow Wb)$ is 100% of the production cross section and branching fraction to Wb for any new pair-produced heavy quark decaying to this channel as a narrow resonance.
 - ¹⁴ AABOUD 17L based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13$ TeV. No signal is found in the search for heavy quark pair production that decay into Zt followed by $Z \rightarrow \nu\nu$ in

Quark Particle Listings

t' (Fourth Generation) Quark

- the events with one lepton, large E_T , and ≥ 4 jets. The lower mass limit 0.87 (1.05) TeV is obtained for the singlet (doublet) model with other possible decay modes.
- SIRUNYAN 17AU based on 2.3-2.6 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Limit on pair-produced singlet vector-like t' using one lepton and several jets. The mass bound is given for a t' transforming as a singlet under the electroweak symmetry group, assumed to decay through W , Z or Higgs boson (which decays to jets) and to a third generation quark. For a doublet, the limit is >830 GeV. Other limits are also given in the paper.
 - AAD 15AR based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used lepton-plus-jets final state. See Fig. 20 for mass limits in the plane of $B(t' \rightarrow Ht)$ vs. $B(t' \rightarrow Wb)$ from a combination of $t't' \rightarrow Wb + X$ and $t't' \rightarrow Ht + X$ searches. Any branching ratio scenario is excluded for mass below 715 GeV.
 - AAD 15BY based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced vector-like t' assuming the branching fractions to W , Z , and h modes of the singlet model. Used events containing $\geq 2\ell + E_T + \geq 2j$ ($\geq 1 b$) and including a same-sign lepton pair.
 - KHACHATRYAN 15AI based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The search exploits all-hadronic final states by tagging boosted Higgs boson using jet substructure and b -tagging.
 - Based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. No significant excess over SM expectation is found in the search for pair production or single production of t' in the events with dilepton from a high p_T Z and additional jets ($\geq 1 b$ -tag). If instead of $B(b' \rightarrow Wt)$ is 1 an electroweak singlet with $B(b' \rightarrow Wt) \sim 0.45$ is assumed, the limit reduces to 685 GeV.
 - Based on 19.5 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The t' quark is pair produced and is assumed to decay into three different final states of bW , tZ , and th . The search is carried out using events with at least one isolated lepton.
 - Based on 1.04 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a quark in the events with dileptons, large E_T , and ≥ 2 jets.
 - Based on 1.04 fb⁻¹ of data in pp collisions at 7 TeV. AAD 12c looked for $t't'$ production followed by t' decaying into a top quark and X , an invisible particle, in a final state with an isolated high- p_T lepton, four or more jets, and a large missing transverse energy. No excess over the SM $t\bar{t}$ production gives the upper limit on $t't'$ production cross section as a function of $m_{t'}$ and m_X . The result is obtained for $B(t' \rightarrow Wt) = 1$.
 - Based on 5 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4th generation quarks that decay to Wb or Wt . Absence of signal in events with one lepton, same-sign dileptons or tripletons gives the bound. With a mass difference of 25 GeV/ c^2 between $m_{t'}$ and $m_{b'}$, the corresponding limit shifts by about ± 20 GeV/ c^2 .
 - Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12P looked for $t't'$ production events with two isolated high p_T leptons, large E_T , and 2 high p_T jets with b -tag. The absence of signal above the SM background gives the limit for $B(t' \rightarrow Wb) = 1$.
 - Based on 4.7 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a b quark in the events with a high p_T isolated lepton, large E_T , and at least 3 jets ($\geq 1 b$ -tag). Vector-like quark of charge $2/3$ with $400 < m_{t'} < 550$ GeV and $B(t' \rightarrow Wb) > 0.63$ is excluded at 95% CL.
 - Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 13I looked for events with one isolated electron or muon, large E_T , and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.
 - Based on 1.04 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found in the search for pair produced heavy quarks that decay into W boson and a b quark in the events with a high p_T isolated lepton, large E_T and at least 3 jets ($\geq 1 b$ -tag).
 - Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12Bc looked for $t't'$ production events with a single isolated high p_T lepton, large E_T and at least 4 high p_T jets with a b -tag. The absence of signal above the SM background gives the limit for $B(t' \rightarrow Wb) = 1$.
 - Based on 5.7 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11AH looked for $t't'$ production followed by t' decaying into a top quark and X , an invisible particle, in the all hadronic decay mode of $t\bar{t}$. No excess over the SM $t\bar{t}$ production gives the upper limit on $t't'$ production cross section as a function of $m_{t'}$ and m_X . The result is obtained for $B(t' \rightarrow Xt) = 1$.
 - Based on 5.6 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11AL looked for $\ell + \geq 4j$ events and set upper limits on $\sigma(t't')$ as functions of $m_{t'}$.
 - Based on 4.8 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11I looked for $t't'$ production signal when t' decays into a top quark and X , an invisible particle, in $\ell + E_T + jets$ channel. No excess over the SM $t\bar{t}$ production gives the upper limit on $t't'$ production cross section as a function of $m_{t'}$ and m_X . The result is obtained for $B(t' \rightarrow Xt) = 1$.
 - Based on 5.3 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. ABAZOV 11Q looked for $\ell + E_T + \geq 4j$ events and set upper limits on $\sigma(t't')$ as functions of $m_{t'}$.
 - Searches for pair production of a new heavy top-like quark t' decaying to a W boson and another quark by fitting the observed spectrum of total transverse energy and reconstructed t' mass in the lepton + jets events.
 - HUANG 08 reexamined the t' mass lower bound of 256 GeV obtained in AALTONEN 08H that assumes $B(b' \rightarrow qZ) = 1$ for $q = u, c$ which does not hold when $m_{b'} < m_{t'} - m_W$ or the mixing $\sin^2(\theta_{bt'})$ is so tiny that the decay occurs outside of the vertex detector. Fig. 1 gives that lower bound on $m_{t'}$ in the plane of $\sin^2(\theta_{bt'})$ and $m_{b'}$.

$t'(5/3)$ -quark/hadron mass limits in $p\bar{p}$ and pp collisions

> 800	95	7 CHATRCHYAN	14T CMS	$t'(5/3) \rightarrow tW^+$

- SIRUNYAN 19T based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Signals are searched in the final states of $t't'$ pair production, with same-sign leptons (which come from a t' decay) or a single lepton (which comes from a W out of $4Ws$), along with jets, and no excess over the SM expectation is found.
- AABOUD 18AW based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Limit on $t'(5/3)$ in pair production assuming its coupling to Wt is equal to one. Lepton-plus-jets final state is used, characterized by $\ell + E_T + jets$ ($\geq 1 b$ -tagged).
- AABOUD 18CE based on 36.1 fb⁻¹ of proton-proton data taken at $\sqrt{s} = 13$ TeV. Events including a same-sign lepton pair are used. The limit is for the pair-produced vector-like t' . With single t' production included, assuming $t't'W$ coupling of one, the limit is $m_{t'} > 1.6$ TeV.
- SIRUNYAN 17J based on 2.3 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Signals are searched in the final states of $t't'$ pair production, with same-sign leptons (which come from a t' decay) or a single lepton (which comes from a W out of $4Ws$), along with jets, and no excess over the SM expectation is found.
- AAD 15BY based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on $t'(5/3)$ in pair and single production assuming its coupling to Wt is equal to one. Used events containing $\geq 2\ell + E_T + \geq 2j$ ($\geq 1 b$) and including a same-sign lepton pair.
- AAD 15Z based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used events with $\ell + E_T + \geq 6j$ ($\geq 1 b$) and at least one pair of jets from weak boson decay, sensitive to the final state $b\bar{b}W^+W^-W^+W^-$.
- CHATRCHYAN 14T based on 19.5 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Non-observation of anomaly in H_T distribution in the same-sign dilepton events leads to the limit when pair produced $t'(5/3)$ quark decays exclusively into t and W^+ , resulting in the final state with $b\bar{b}W^+W^-W^+W^-$.

$t'(2/3)$ mass limits from single production in $p\bar{p}$ and pp collisions

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>950	95	1 AAD	16AV ATLS	$qg \rightarrow q't'b, B(t' \rightarrow Wb)=0.5$
>403	95	2 ABAZOV	11F D0	$qd \rightarrow q't' \rightarrow q'(Wd)$ $\bar{\kappa}_{dt'}=1, B(t' \rightarrow Wd)=1$
>551	95	2 ABAZOV	11F D0	$qu \rightarrow q't' \rightarrow q(Zu)$ $\bar{\kappa}_{ut'}=\sqrt{2}, B(t' \rightarrow Zu)=1$

- AAD 16AV based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. No significant excess over SM expectation is found in the search for a fully reconstructed vector-like t' in the mode $\ell + E_T + \geq 2j$ ($\geq 1 b$). A veto on massive large-radius jets is used to reject the $t\bar{t}$ background.
- Based on 5.4 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. ABAZOV 11F looked for single production of t' via the Z or E coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes $p\bar{p} \rightarrow t'q \rightarrow (Wd)q$, and $p\bar{p} \rightarrow t'q \rightarrow (Zd)q$ are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.

$t'(5/3)$ mass limits from single production in $p\bar{p}$ and pp collisions

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
•••	1 SIRUNYAN	19AI CMS	$tW \rightarrow t'(5/3) \rightarrow tW$

- SIRUNYAN 19AI based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Exclusion limits are set on the product of the production cross section and branching fraction for the $b'(-1/3) + t$ and $t'(5/3) + t$ modes as a function of the vector-like quark mass in Fig. 8 and Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.

Free Quark Searches

FREE QUARK SEARCHES

The basis for much of the theory of particle scattering and hadron spectroscopy is the construction of the hadrons from a set of fractionally charged constituents (quarks). A central element of Quantum Chromodynamics is that quarks cannot be observed as free particles but are confined to mesons and baryons. Experiments have produced no evidence for free quarks.

This compilation is only a guide to the literature, since the quoted experimental limits are often only indicative. Reviews can be found in Refs. 1–4.

¹ CHATRCHYAN 13AR limits assume pair-produced long-lived spin-1/2 particles neutral under SU(3)_C and SU(2)_L.
² ABE 92J flux limits decrease as the mass increases from 50 to 500 GeV.
³ HE 91 limits are for charges of the form $N \pm 1/3$ from 23/3 to 38/3.
⁴ Hadronic or leptonic quarks.
⁵ Cross section cm²/GeV².
⁶ 3×10^{-5} < lifetime < 1×10^{-3} s.
⁷ Includes BOTT 72 results.
⁸ Assumes isotropic cm production.
⁹ Cross section inferred from flux.

Quark Flux — Accelerator Searches

The definition of FLUX depends on the experiment

- (a) is the ratio of measured free quarks to predicted free quarks if there is no “confinement.”
- (b) is the probability of fractional charge on nuclear fragments. Energy is in GeV/nucleon.
- (c) is the 90%CL upper limit on fractionally-charged particles produced per interaction.
- (d) is quarks per collision.
- (e) is inclusive quark-production cross-section ratio to $\sigma(e^+e^- \rightarrow \mu^+\mu^-)$.
- (f) is quark flux per charged particle.
- (g) is the flux per ν -event.
- (h) is quark yield per π^- yield.
- (i) is 2-body exclusive quark-production cross-section ratio to $\sigma(e^+e^- \rightarrow \mu^+\mu^-)$.

1 HUENTRUP 96 quote 95% CL limits for production of fragments with charge differing by as much as ±1/3 (in units of e) for charge 6 ≤ Z ≤ 10.
 2 BUSKULIC 93c limits for inclusive quark production are more conservative if the ALEPH hadronic fragmentation function is assumed.
 3 CECCHINI 93 limit at 90%CL for 23/3 ≤ Z ≤ 40/3, for 16A GeV O, 14.5A Si, and 200A S incident on Cu target. Other limits are 2.3 × 10⁻⁴ for 17/3 ≤ Z ≤ 20/3 and 1.2 × 10⁻⁴ for 20/3 ≤ Z ≤ 23/3.
 4 GHOSH 92 reports measurement of spallation fragment charge based on ionization in emulsion. Out of 650 measured tracks, 2 were consistent with charge 5e/3, and 4 with 7e/3.
 5 Hadronic quark.
 6 Leptonic quark.
 7 HE 91 limits are for charges of the form N±1/3 from 23/3 to 38/3, and correspond to cross-section limits of 380μb (Pb) and 320μb (Cu).
 8 The limits apply to projectile fragment charges of 17, 19, 20, 22, 23 in units of e/3.
 9 The limits apply to projectile fragment charges of 16, 17, 19, 20, 22, 23 in units of e/3.
 10 Flux limits and mass range depend on charge.
 11 Bound to nuclei.
 12 Quark lifetimes > 1 × 10⁻⁸ s.
 13 One candidate m < 0.17 GeV.

1 See AGNESE 15 Fig.6 for limits on vertical density as function of charge extending to |q|/e < 1/10.
 2 AMBROSIO 00c limit is below 11 × 10⁻¹⁵ for 0.25 < q/e < 0.5, and is changing rapidly near q/e=2/3, where it is 2 × 10⁻¹⁴.
 3 Distribution in celestial sphere was described as anisotropic.
 4 With telescope axis at zenith angle 40° to the south.
 5 Leptonic quarks.
 6 Lifetime > 10⁻⁸ s; charge ±0.70, 0.68, 0.42; and mass >4.4, 4.8, and 20 GeV, respectively.
 7 Time delayed air shower search.
 8 Prompt air shower search.
 9 Also e/4 and e/6 charges.
 10 No events in subsequent experiments.

Quark Flux — Cosmic Ray Searches

Shielding values followed with an asterisk indicate altitude in km. Shielding values not followed with an asterisk indicate sea level in kg/cm².

1 95% CL limit for fractional charge particles with 0.18e ≤ |Q_{residual}| ≤ 0.82e in total of 70.1 mg of silicone oil.

See key on page 999

Quark Particle Listings
Free Quark Searches

- ² 95% CL limit for particles with fractional charge $|Q_{residual}| > 0.16e$ in total of 17.4 mg of silicone oil.
- ³ Also set limits for $Q = \pm e/6$.
- ⁴ Note that in PHILLIPS 88 these authors report a subtle magnetic effect which could account for the apparent fractional charges.
- ⁵ Limit inferred by JONES 77b.

π^\pm

$$I^G(J^P) = 1^-(0^-)$$

We have omitted some results that have been superseded by later experiments. The omitted results may be found in our 1988 edition Physics Letters **B204** 1 (1988).

π^\pm MASS

The most accurate charged pion mass measurements are based upon x-ray wavelength measurements for transitions in π^- -mesonic atoms. The observed line is the blend of three components, corresponding to different K-shell occupancies. JECKELMANN 94 revisits the occupancy question, with the conclusion that two sets of occupancy ratios, resulting in two different pion masses (Solutions A and B), are equally probable. We choose the higher Solution B since only this solution is consistent with a positive mass-squared for the muon neutrino, given the precise muon momentum measurements now available (DAUM 91, ASSAMAGAN 94, and ASSAMAGAN 96) for the decay of pions at rest. Earlier mass determinations with pi-mesonic atoms may have used incorrect K-shell screening corrections.

Measurements with an error of > 0.005 MeV have been omitted from this Listing.

¹ DAUM 19 value is based on their previous (1991+1996) measurements of the μ^+ momentum of 29.79200 ± 0.00011 MeV for π^+ decay at rest. It also uses $m_\mu = 105.6583745 \pm 0.0000024$ MeV, and assumes conservatively $m_{\nu_\mu} = 2.0 \pm 2.0$ MeV. It is the most precise charged pion mass determination.

² TRASSINELLI 16 use the muonic oxygen line for online energy calibration of the pionic line.

³ LENZ 98 result does not suffer K-electron configuration uncertainties as does JECKELMANN 94.

⁴ JECKELMANN 94 Solution B (dominant 2-electron K-shell occupancy), chosen for consistency with positive $m_{\nu_\mu}^2$.

⁵ ASSAMAGAN 96 measures the μ^+ momentum p_μ in $\pi^+ \rightarrow \mu^+ \nu_\mu$ decay at rest to be 29.79200 ± 0.00011 MeV/c. Combined with the μ^+ mass and the assumption $m_{\nu_\mu} = 0$, this gives the π^+ mass above; if $m_{\nu_\mu} > 0$, m_{π^+} given above is a lower limit. Combined instead with m_μ and (assuming CPT) the π^- mass of JECKELMANN 94, p_μ gives an upper limit on m_{ν_μ} (see the ν_μ).

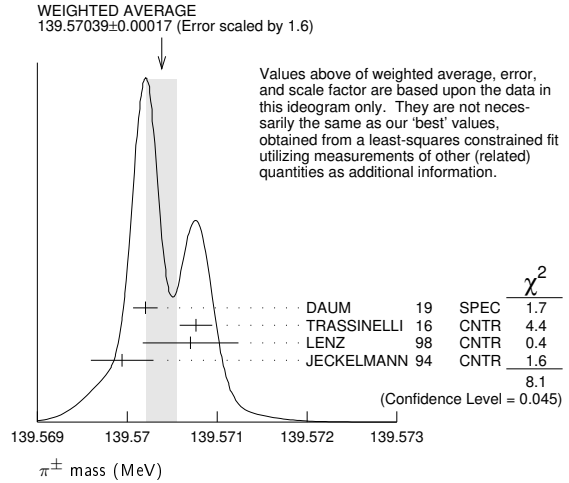

⁶ JECKELMANN 94 Solution A (small 2-electron K-shell occupancy) in combination with either the DAUM 91 or ASSAMAGAN 94 pion decay muon momentum measurement yields a significantly negative $m_{\nu_\mu}^2$. It is accordingly not used in our fits.

⁷ The DAUM 91 value includes the ABELA 84 result. The value is based on a measurement of the μ^+ momentum for π^+ decay at rest, $p_\mu = 29.79179 \pm 0.00053$ MeV, uses $m_\mu = 105.658389 \pm 0.000034$ MeV, and assumes that $m_{\nu_\mu} = 0$. The last assumption means that in fact the value is a lower limit.

⁸ JECKELMANN 86b gives $m_\pi/m_e = 273.12677(71)$. We use $m_e = 0.51099906(15)$ MeV from COHEN 87. The authors note that two solutions for the probability distribution of K-shell occupancy fit equally well, and use other data to choose the lower of the two possible π^\pm masses.

⁹ These values are scaled with a new wavelength-energy conversion factor $V\lambda = 1.23984244(37) \times 10^{-6}$ eV m from COHEN 87. The LU 80 screening correction relies upon a theoretical calculation of inner-shell refilling rates.

¹⁰ This MARUSHENKO 76 value used at the authors' request to use the accepted set of calibration γ energies. Error increased from 0.0017 MeV to include QED calculation error of 0.0017 MeV (12 ppm).

Meson Particle Listings

 π^\pm π^\pm DECAY MODES π^\pm modes are charge conjugates of the modes below.

For decay limits to particles which are not established, see the section on Searches for Axions and Other Very Light Bosons.

Mode	Fraction (Γ_i/Γ)	Confidence level
Γ_1 $\mu^+ \nu_\mu$	[a] (99.98770 ± 0.00004) %	
Γ_2 $\mu^+ \nu_\mu \gamma$	[b] (2.00 ± 0.25) × 10 ⁻⁴	
Γ_3 $e^+ \nu_e$	[a] (1.230 ± 0.004) × 10 ⁻⁴	
Γ_4 $e^+ \nu_e \gamma$	[b] (7.39 ± 0.05) × 10 ⁻⁷	
Γ_5 $e^+ \nu_e \pi^0$	(1.036 ± 0.006) × 10 ⁻⁸	
Γ_6 $e^+ \nu_e e^+ e^-$	(3.2 ± 0.5) × 10 ⁻⁹	
Γ_7 $e^+ \nu_e \nu \bar{\nu}$	< 5 × 10 ⁻⁶	90%

Lepton Family number (LF) or Lepton number (L) violating modes

Γ_8 $\mu^+ \bar{\nu}_e$	L	[c] < 1.5	× 10 ⁻³	90%
Γ_9 $\mu^+ \nu_e$	LF	[c] < 8.0	× 10 ⁻³	90%
Γ_{10} $\mu^- e^+ e^+ \nu$	LF	< 1.6	× 10 ⁻⁶	90%

[a] Measurements of $\Gamma(e^+ \nu_e)/\Gamma(\mu^+ \nu_\mu)$ always include decays with γ 's, and measurements of $\Gamma(e^+ \nu_e \gamma)$ and $\Gamma(\mu^+ \nu_\mu \gamma)$ never include low-energy γ 's. Therefore, since no clean separation is possible, we consider the modes with γ 's to be subreactions of the modes without them, and let $[\Gamma(e^+ \nu_e) + \Gamma(\mu^+ \nu_\mu)]/\Gamma_{\text{total}} = 100\%$.

[b] See the Particle Listings below for the energy limits used in this measurement; low-energy γ 's are not included.

[c] Derived from an analysis of neutrino-oscillation experiments.

¹POCANIC 04 normalizes to $e^+ \nu_e$ decays, using the PDG 2004 value $B(\pi^+ \rightarrow e^+ \nu_e) = (1.230 \pm 0.004) \times 10^{-4}$. We add their statistical (0.004×10^{-8}) , systematic (0.004×10^{-8}) and systematic error due to the uncertainty of $B(\pi^+ \rightarrow e^+ \nu_e)$ (0.003×10^{-8}) in quadrature.

²This result can be used to calculate V_{ud} from pion beta decay: $V_{ud}^{PIBETA} = 0.9728 \pm 0.0030$.

³MCFARLANE 85 combines a measured rate $(0.394 \pm 0.015)/s$ with 1982 PDG mean life.

⁴DEPOMMIER 68 says the result of DEPOMMIER 63 is at least 10% too large because of a systematic error in the π^0 detection efficiency, and that this may be true of all the previous measurements (also V. Soergel, private communication, 1972).

0.011 ± 0.003		1,4,5 STETZ	78 SPEC	$\pi^+ \rightarrow e^+ \nu_\gamma$

- These values come from fixing the vector form factor at the CVC prediction, $F_V = 0.0259 \pm 0.0005$.
- When F_V is released, the BYCHKOV 09 F_A is 0.0117 ± 0.0017 , and F_A and F_V results are highly (anti-)correlated: $F_A + 1.0286 F_V = 0.03853 \pm 0.00014$.
- The sign of $\gamma = F_A / F_V$ is determined to be positive.
- Only the absolute value of F_A is determined.
- The result of STETZ 78 has a two-fold ambiguity. We take the solution compatible with later determinations.

π^\pm CHARGE RADIUS

The charge radius of the pion $\sqrt{\langle r_\pi^2 \rangle}$ is defined in relation to the form factor of the pion electromagnetic vertex, called vector form factor VFF, F_V^+ . The VFF is a function of the squared four-momentum transfer t , or of the squared c.m. energy s , depending on the channel in which the photon exchange takes place. In both cases, it is related to the slope of the VFF at zero, namely

$$\langle r_\pi^2 \rangle = 6 \frac{dF_V^+(q)}{dq} (q=0) \text{ where } q = t, s.$$

The quantity cannot be measured directly. It can be extracted from the cross sections of three processes: pion electroproduction, $eN \rightarrow eN\pi$, and pion electron scattering $e\pi \rightarrow e\pi$, for the t channel, and positron electron annihilation into two charged pions, $e^+e^- \rightarrow \pi^+\pi^-$, for the s channel. We encode all measurements, but we do not use electroproduction data in averaging because the extraction of the pion radius involves, in this case, theoretical uncertainties that cannot be controlled at the needed level of accuracy. In case of analyses based on the same data set, as ANANTHANARAYAN 17 and COLANGELO 19, which cannot be averaged, we combine the results into a common value, with the uncertainty range chosen to cover both analyses. Note that for consistency the form factor needs to be defined in both channels with the vacuum polarisation removed. For details see COLANGELO 19 or Appendix B of ANANTHANARAYAN 16a.

- This value combines the measurements of ANANTHANARAYAN 17 and COLANGELO 19 which are based on the same data set. The uncertainty range is chosen to cover both results.
- COLANGELO 19 fit existing F_V data, using an extended Omnes dispersive representation. This analysis is based on the same data set of ANANTHANARAYAN 17. Accordingly, they cannot be averaged. We combine the results into a common value, with the uncertainty range chosen to cover the uncertainty ranges of both analyses.
- ANANTHANARAYAN 17 fit existing F_V data, using a mixed phase-modulus dispersive representation. This analysis is based on the same data set of COLANGELO 19. Accordingly, they cannot be averaged. We combine the results into a common value, with the uncertainty range chosen to cover the uncertainty ranges of both analyses.
- According to the authors the uncertainty could be underestimated. The value quoted omits the BaBar data AUBERT 09.
- The extractions could contain an additional theoretical uncertainty which cannot be sufficiently quantified.

⁶ BIJNENS 98 fits existing data.

⁷ The extraction is based on a parametrization that does not have correct analytic properties.

π^0 MEAN LIFE

Most experiments measure the π^0 width which we convert to a lifetime. ATHERTON 85 is the only direct measurement of the π^0 lifetime. Our average based only on indirect measurement yields $(8.30 \pm 0.19) \times 10^{-17}$ s. The two Primakoff measurements from 1970 have been excluded from our average because they suffered model-related systematics unknown at the time. More information on the π^0 lifetime can be found in BERNSTEIN 13.

VALUE (10^{-17} s)	EVTS	DOCUMENT ID	TECN	COMMENT
8.32 ± 0.18 OUR AVERAGE				Error includes scale factor of 1.2.

9 ± 0.68		KRYSHKIN 70	CNTR	Primakoff effect
7.3 ± 1.1		BELLETTINI 65B	CNTR	Primakoff effect
¹ LARIN 11 reported $\Gamma(\pi^0 \rightarrow \gamma\gamma) = 7.82 \pm 0.14 \pm 0.17$ eV which we converted to mean life $\tau = \hbar/\Gamma(\text{total})$.				
² BYCHKOV 09 obtains this using the conserved-vector-current relation between the vector form factor F_V and the π^0 lifetime.				
³ WILLIAMS 88 gives $\Gamma(\gamma\gamma) = 7.7 \pm 0.5 \pm 0.5$ eV. We give here $\tau = \hbar/\Gamma(\text{total})$.				
⁴ BROWMAN 74 gives a π^0 width $\Gamma = 8.02 \pm 0.42$ eV. The mean life is \hbar/Γ .				

π^0 DECAY MODES

[a] Astrophysical and cosmological arguments give limits of order 10^{-13} .

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 4.6$ for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

3.18 ± 0.30	146	² SAMIOS 62B	HBC	

¹This ABOUZAID 08D value includes all radiative final states. The error includes both statistical and systematic errors. The correlation between the Dalitz-pair planes gives a direct measurement of the π^0 parity. The $\pi^0 2\gamma^*$ form factor is measured and limits are placed on a scalar contribution to the decay.
²SAMIOS 62B value uses a Panofsky ratio = 1.62.

$\Gamma(e^+ e^-) / \Gamma_{\text{total}}$

Experimental results are listed; branching ratios corrected for radiative effects are given in the footnotes. BERMAN 60 found $B(\pi^0 \rightarrow e^+ e^-) \geq 4.69 \times 10^{-8}$ via an exact QED calculation.

 6.09 ± 0.40 ± 0.24 275 4 ALAVI-HARATI 99c SPEC 0 Repl. by ABOUZAID 07

¹ ABOUZAID 07 result is for $m_{e^+e^-/\pi^0} > 0.95$. With radiative corrections the result becomes $(7.48 \pm 0.29 \pm 0.25) \times 10^{-8}$.

² The DESHPANDE 93 result with bremsstrahlung radiative corrections is $(8.0 \pm 2.6 \pm 0.6) \times 10^{-8}$.

³ The MCFARLAND 93 result is for $B[\pi^0 \rightarrow e^+e^-, (m_{e^+e^-/\pi^0})^2 > 0.95]$. With radiative corrections it becomes $(8.8_{-3.2}^{+4.5} \pm 0.6) \times 10^{-8}$.

⁴ ALAVI-HARATI 99c quote result for $B[\pi^0 \rightarrow e^+e^-, (m_{e^+e^-/\pi^0})^2 > 0.95]$ to minimize radiative contributions from $\pi^0 \rightarrow e^+e^-\gamma$. After radiative corrections they obtain $(7.04 \pm 0.46 \pm 0.28) \times 10^{-8}$.

π^0 ELECTROMAGNETIC FORM FACTOR

The amplitude for the process $\pi^0 \rightarrow e^+e^-\gamma$ contains a form factor $F(x)$ at the $\pi^0\gamma\gamma$ vertex, where $x = [m_{e^+e^-/\pi^0}]^2$. The parameter a in the linear expansion $F(x) = 1 + ax$ is listed below.

All the measurements except that of BEHREND 91 are in the time-like region of momentum transfer.

LINEAR COEFFICIENT OF π^0 ELECTROMAGNETIC FORM FACTOR

-24 ± 16	3.0k	SAMIOS 61	HBC	No radiation corr.

¹ BEHREND 91 estimates that their systematic error is of the same order of magnitude as their statistical error, and so we have included a systematic error of this magnitude. The value of a is obtained by extrapolation from the region of large space-like momentum transfer assuming vector dominance.

² TUPPER 83 is a theoretical analysis of FISCHER 78 including 2-photon exchange in the corrections.

³ The FISCHER 78 error is statistical only. The result without radiation corrections is $+0.05 \pm 0.03$.

η

$$I^G(J^{PC}) = 0^+(0^{-+})$$

We have omitted some results that have been superseded by later experiments. The omitted results may be found in our 1988 edition Physics Letters **B204** (1988).

η MASS

Recent measurements resolve the obvious inconsistency in previous η mass measurements in favor of the higher value first reported by NA48 (LA1 02). We use only precise measurements consistent with this higher mass value for our η mass average.

[a] Forbidden by angular momentum conservation.

[b] C parity forbids this to occur as a single-photon process.

CONSTRAINED FIT INFORMATION

An overall fit to 2 decay rate and 19 branching ratios uses 50 measurements and one constraint to determine 9 parameters. The overall fit has a $\chi^2 = 43.8$ for 42 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

 η DECAY RATES $\Gamma(2\gamma)$ Γ_2

See the table immediately above giving the fitted decay rates. Following the advice of NEFKENS 02, we have removed the Primakoff-effect measurement from the average. See also the "Note on the Decay Width $\Gamma(\eta \rightarrow \gamma\gamma)$," in our 1994 edition, Phys. Rev. D50, 1 August 1994, Part I, p. 1451, for a discussion of the various measurements.

• • • We do not use the following data for averages, fits, limits, etc. • • •				
0.476 \pm 0.062		¹ RODRIGUES	08	CNTR Reanalysis
0.64 \pm 0.14 \pm 0.13		AIHARA	86	TPC $e^+ e^- \rightarrow e^+ e^- \eta$
0.56 \pm 0.16	56	WEINSTEIN	83	CBAL $e^+ e^- \rightarrow e^+ e^- \eta$
0.324 \pm 0.046		BROWMAN	74B	CNTR Primakoff effect
1.00 \pm 0.22		² BEMPORAD	67	CNTR Primakoff effect

¹RODRIGUES 08 uses a more sophisticated calculation for the inelastic background due to incoherent photoproduction to reanalyze the η photoproduction data on Be and Cu at 9 GeV from BROWMAN 74B. This brings the value of $\Gamma(\eta \rightarrow 2\gamma)$ in line with direct measurements of the width. The error here is only statistical.

²BEMPORAD 67 gives $\Gamma(2\gamma) = 1.21 \pm 0.26$ keV assuming $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.314$. Bemporad private communication gives $\Gamma(2\gamma)^2/\Gamma(\text{total}) = 0.380 \pm 0.083$. We evaluate this using $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.38 \pm 0.01$. Not included in average because the uncertainty resulting from the separation of the coulomb and nuclear amplitudes has apparently been underestimated.

Meson Particle Listings

 $f_0(500)$

- ³ Uses the K_{e4} data of BATLEY 10c and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73, GRAYER 74, and PROTOPOESCU 73.
- ⁴ Analytic continuation using Roy equations.
- ⁵ Analytic continuation using GKPY equations.
- ⁶ Using Roy equations.
- ⁷ Average of three variants of the analytic K-matrix model. Uses the K_{e4} data of BATLEY 08a and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73 and GRAYER 74.
- ⁸ Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08a, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82b.
- ⁹ From the K_{e4} data of BATLEY 08a and $\pi N \rightarrow \pi\pi N$ data of HYAMS 73.
- ¹⁰ From the K_{e4} data of BATLEY 08a and $\pi N \rightarrow \pi\pi N$ data of PROTOPOESCU 73, GRAYER 74, and ESTABROOKS 74.
- ¹¹ From a mean of three different $f_0(500)$ parameterizations. Uses 40k events.
- ¹² From an isobar model using 2.6k events.
- ¹³ Reanalysis of ABLIKIM 04a, PISLAK 01, and HYAMS 73 data.
- ¹⁴ Using the N/D method.
- ¹⁵ From the solution of the Roy equation (ROY 71) for the isoscalar S-wave and using a phase-shift analysis of HYAMS 73 and PROTOPOESCU 73 data.
- ¹⁶ Reanalysis of the data from PROTOPOESCU 73, ESTABROOKS 74, GRAYER 74, ROSSELET 77, PISLAK 03, and AKHMETSHIN 04.
- ¹⁷ From a mean of six different analyses and $f_0(500)$ parameterizations.
- ¹⁸ Using data on $\psi(2S) \rightarrow J/\psi\pi\pi$ from BAI 00E and on $\Upsilon(nS) \rightarrow \Upsilon(mS)\pi\pi$ from BUTLER 94b and ALEXANDER 98.
- ¹⁹ Reanalysis of data from PROTOPOESCU 73, ESTABROOKS 74, GRAYER 74, and COHEN 80 in the unitarized ChPT model.
- ²⁰ From a combined analysis of HYAMS 73, AUGUSTIN 89, AITALA 01b, and PISLAK 01.
- ²¹ A similar analysis (KOMADA 01) finds $(580^{+79}_{-30}) - i(190^{+107}_{-49})$ MeV.
- ²² Coupled channel reanalysis of BATON 70, BENSINGER 71, BAILLON 72, HYAMS 73, HYAMS 75, ROSSELET 77, COHEN 80, and ETKIN 82b using the uniformizing variable.
- ²³ Using the inverse amplitude method and data of ESTABROOKS 73, GRAYER 74, and PROTOPOESCU 73.
- ²⁴ Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
- ²⁵ Average and spread of 4 variants ("up" and "down") of KAMINSKI 97b 3-channel model.
- ²⁶ Uses data from BEIER 72b, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CASON 83, ASTON 88, and ARMSTRONG 91b. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.
- ²⁷ Demonstrates explicitly that $f_0(500)$ and $f_0(1370)$ are two different poles.
- ²⁸ Analysis of data from FALVARD 88.
- ²⁹ Analysis of data from OCHS 73, ESTABROOKS 75, ROSSELET 77, and MUKHIN 80.
- ³⁰ Analysis of data from OCHS 73, GRAYER 74, and ROSSELET 77.
- ³¹ Coupled-channel analysis using data from PROTOPOESCU 73, HYAMS 73, HYAMS 75, GRAYER 74, ESTABROOKS 74, ESTABROOKS 75, FROGGATT 77, CORDEEN 79, BISWAS 81.
- ³² Analysis of data from APEL 72c, GRAYER 74, CASON 76, PAWLICKI 77. Includes spread and errors of 4 solutions.
- ³³ Analysis of data from BATON 70, BENSINGER 71, COLTON 71, BAILLON 72, PROTOPOESCU 73, and WALKER 67.

- ⁵⁶ Using dispersive analysis with phases from GARCIA-MARTIN 11a and BUETTNER 04 as input.
- ⁵⁷ Using Roy-Steiner equations with $\pi\pi$ phase shifts from an update of COLANGELO 01 and from GARCIA-MARTIN 11a.
- ⁵⁸ Using an analytic K-matrix model.
- ⁵⁹ Using dispersion integral with phase input from Roy equations and data from MAR-SISKE 90, BOYER 90, BEHREND 92, UEHARA 08a, and MORI 07.
- ⁶⁰ Used dispersion theory. The value quoted used the $f_0(500)$ pole position of $457 - i276$ MeV.
- ⁶¹ Using p, n polarizabilities from PDG 06 and fitting to $\pi\pi$ phase motion from GARCIA-MARTIN 07 and σ -poles from GARCIA-MARTIN 07 and CAPRINI 06.
- ⁶² Using twice-subtracted dispersion integrals.
- ⁶³ Supersedes OLLER 08.
- ⁶⁴ Solution A (preferred solution based on χ^2 -analysis).

See key on page 999

Meson Particle Listings

 $f_0(500), \rho(770)$

- ⁶⁵ Dispersion theory based amplitude analysis of BOYER 90, MARSISKE 90, BEHREND 92, and MORI 07.
⁶⁶ Solution B (worse than solution A; still acceptable when systematic uncertainties are included).
⁶⁷ Using unitarity and the σ pole position from CAPRINI 06.
⁶⁸ This width could equally well be assigned to the $f_0(1370)$. The authors analyse data from BOYER 90 and MARSISKE 90 and report strong correlation with $\gamma\gamma$ width of $f_2(1270)$.
⁶⁹ Supersedes MORGAN 90.

 $\rho(770)$ THE $\rho(770)$

$$I^G(J^{PC}) = 1^+(1^-)$$

Updated September 2019 by S. Eidelman (Novosibirsk) and G. Venanzoni (Pisa).

The determination of the parameters of the $\rho(770)$ is beset with many difficulties because of its large width. In physical region fits, the line shape does not correspond to a relativistic Breit-Wigner function with a P -wave width, but requires some additional shape parameter. This dependence on parameterization was demonstrated long ago [1]. Bose-Einstein correlations are another source of shifts in the $\rho(770)$ line shape, particularly in multiparticle final-state systems [2].

The same model dependence afflicts any other source of resonance parameters, such as the energy dependence of the phase shift δ_1^+ , or the pole position. It is, therefore, not surprising that a study of $\rho(770)$ dominance in the decays of the η and η' reveals the need for specific dynamical effects, in addition to the $\rho(770)$ pole [3,4].

The cleanest determination of the $\rho(770)$ mass and width comes from e^+e^- annihilation and τ -lepton decays. Analysis of ALEPH [5] showed that the charged $\rho(770)$ parameters measured from τ -lepton decays are consistent with those of the neutral one determined from e^+e^- data [6]. This conclusion is qualitatively supported by the later studies of CLEO [7] and Belle [8]. However, comparison of the two-pion mass spectrum in τ decays from OPAL [9], CLEO [7], and ALEPH [10,11], and the $e^+e^- \rightarrow \pi^+\pi^-$ cross section from CMD-2 [12,13], showed significant discrepancies between the two shapes which can be as high as 10% above the ρ meson [14,15]. This discrepancy remains after measurements of the two-pion cross section in e^+e^- annihilation at KLOE [16,17,18,19], SND [20,21], BaBar [22] and, more recently BESIII [23]. The effect is not accounted for by isospin breaking [24,25,26,27], but the accuracy of its calculation may be overestimated [28,29].

This problem seems to be solved after a recent analysis in [30] which showed that after correcting the τ data for the missing $\rho - \gamma$ mixing contribution, besides the other known isospin symmetry violating corrections, the $\pi\pi$ I=1 part of the hadronic vacuum polarization contribution to the muon $g - 2$ is fully compatible between τ based and e^+e^- based evaluations. The global fit of the whole set of the ρ , ω , and ϕ decays, taking into account mixing effects in the hidden local symmetry model, also showed consistency of the data on τ decays to two pions and e^+e^- annihilation [31,32]. However, because

Meson Particle Listings

 $\rho(770)$

of the progress in e^+e^- data, the τ input is now less precise and less reliable due to additional theoretical uncertainties [33] decreasing importance of τ versus e^+e^- comparison for the determination of $\rho(770)$ parameters and other applications, like, e.g., calculations of hadronic vacuum polarization.

- ¹ Without limitations on masses and widths.

$\rho(770)$ RANGE PARAMETER

The range parameter R enters an energy-dependent correction to the width, of the form $(1 + q_r^2 R^2) / (1 + q^2 R^2)$, where q is the momentum of one of the pions in the $\pi\pi$ rest system. At resonance, $q = q_r$.

$\rho(770)$ DECAY MODES

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level
$\Gamma_1 \pi\pi$	~ 100	%
$\rho(770)^\pm$ decays		
$\Gamma_2 \pi^\pm \pi^0$	~ 100	%
$\Gamma_3 \pi^\pm \gamma$	(4.5 ± 0.5) × 10 ⁻⁴	S=2.2
$\Gamma_4 \pi^\pm \eta$	< 6	× 10 ⁻³ CL=84%
$\Gamma_5 \pi^\pm \pi^+ \pi^- \pi^0$	< 2.0	× 10 ⁻³ CL=84%
$\rho(770)^0$ decays		
$\Gamma_6 \pi^+ \pi^-$	~ 100	%
$\Gamma_7 \pi^+ \pi^- \gamma$	(9.9 ± 1.6) × 10 ⁻³	S=1.4
$\Gamma_8 \pi^0 \gamma$	(4.7 ± 0.6) × 10 ⁻⁴	
$\Gamma_9 \eta \gamma$	(3.00 ± 0.21) × 10 ⁻⁴	
$\Gamma_{10} \pi^0 \pi^0 \gamma$	(4.5 ± 0.8) × 10 ⁻⁵	
$\Gamma_{11} \mu^+ \mu^-$	[a] (4.55 ± 0.28) × 10 ⁻⁵	
$\Gamma_{12} e^+ e^-$	[a] (4.72 ± 0.05) × 10 ⁻⁵	
$\Gamma_{13} \pi^+ \pi^- \pi^0$	(1.01 + ^{0.54} / _{-0.36} ± 0.34) × 10 ⁻⁴	
$\Gamma_{14} \pi^+ \pi^- \pi^+ \pi^-$	(1.8 ± 0.9) × 10 ⁻⁵	
$\Gamma_{15} \pi^+ \pi^- \pi^0 \pi^0$	(1.6 ± 0.8) × 10 ⁻⁵	
$\Gamma_{16} \pi^0 e^+ e^-$	< 1.2	× 10 ⁻⁵ CL=90%
$\Gamma_{17} \eta e^+ e^-$		

[a] The $\omega\rho$ interference is then due to $\omega\rho$ mixing only, and is expected to be small. If $e\mu$ universality holds, $\Gamma(\rho^0 \rightarrow \mu^+ \mu^-) = \Gamma(\rho^0 \rightarrow e^+ e^-) \times 0.99785$.

CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 10 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 10.7$ for 8 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$\Gamma_3 \pi^\pm \gamma$	0.068 ± 0.007	2.3

CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 7 branching ratios uses 22 measurements and one constraint to determine 9 parameters. The overall fit has a $\chi^2 = 9.5$ for 14 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

9.7 ^{+3.1} / _{-3.3}	^{3,4} HYAMS 67	OSPK	11 $\pi^- \text{Li, H}$

¹Possibly large $\rho\text{-}\omega$ interference leads us to increase the minus error.

²Result contains 11 ± 11% correction using SU(3) for central value. The error on the correction takes account of possible $\rho\text{-}\omega$ interference and the upper limit agrees with the upper limit of $\omega \rightarrow \mu^+\mu^-$ from this experiment.

³But he even enlarges his error to take residual ω contamination into account. Since his value is high, seems the other experiments also can't have too many ω 's. But maybe Hyams has additional μ 's from $\rho \rightarrow \pi\pi$, decaying π 's.

⁴HYAMS 67's mass resolution is 20 MeV. The ω region was excluded.

- Update of AKHMETSIN 00c.
- From the combined fit of ANTONELLI 92, ACHASOV 01e, ACHASOV 02e, and ACHASOV 03d data on the $\pi^+\pi^-\pi^0$ and ANTONELLI 92 on the $\omega\pi^+\pi^-$ final states. Supersedes ACHASOV 99e and ACHASOV 02e.
- From the $\eta \rightarrow \gamma\gamma$ decay.
- From the $\eta \rightarrow 3\pi^0$ decay.
- Observed by threshold-crossing technique. Mass resolution = 4.8 MeV FWHM.
- From the $\rho-\omega$ interference in the $\pi^+\pi^-$ mass spectrum using the Breit-Wigner for the ω and leaving its mass and width as free parameters of the fit.
- Systematic uncertainties underestimated.
- From best-resolution sample of COYNE 71.
- From $\omega-\rho$ interference in the $\pi^+\pi^-$ mass spectrum assuming ω width 12.6 MeV.

CONSTRAINED FIT INFORMATION

An overall fit to 15 branching ratios uses 55 measurements and one constraint to determine 10 parameters. The overall fit has a $\chi^2 = 57.0$ for 46 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

7.3 ± 2.9 ^{2,4} DOLINSKY 89 ND $e^+e^- \rightarrow \eta\gamma$

¹ No flat $\eta\eta\gamma$ background assumed.
² Solution corresponding to constructive $\omega\rho$ interference.
³ ACHASOV 07B reports $[\Gamma(\omega(782) \rightarrow \eta\gamma)/\Gamma_{total}] \times [B(\omega(782) \rightarrow e^+e^-)] = (3.10 \pm 0.31 \pm 0.11) \times 10^{-8}$ which we divide by our best value $B(\omega(782) \rightarrow e^+e^-) = (7.36 \pm 0.15) \times 10^{-5}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Supersedes ACHASOV 00D and ACHASOV 06A.
⁴ Not independent of the corresponding $\Gamma(e^+e^-) \times \Gamma(\eta\gamma)/\Gamma_{total}^2$.
⁵ Using $B(\omega \rightarrow e^+e^-) = (7.14 \pm 0.13) \times 10^{-5}$ and $B(\eta \rightarrow \gamma\gamma) = 39.43 \pm 0.26\%$.
⁶ Using $B(\omega \rightarrow e^+e^-) = (7.07 \pm 0.19) \times 10^{-5}$ and using $B(\eta \rightarrow 3\pi^0) = (32.24 \pm 0.29) \times 10^{-2}$. Solution corresponding to constructive $\omega\rho$ interference. The combined fit from 600 to 1380 MeV taking into account $\rho(770)$, $\omega(782)$, $\phi(1020)$, and $\rho(1450)$ (mass and width fixed at 1450 MeV and 310 MeV respectively). Not independent of the corresponding $\Gamma(e^+e^-) \times \Gamma(\eta\gamma)/\Gamma_{total}^2$.
⁷ Depending on the degree of coherence with the flat $\eta\eta\gamma$ background and using $B(\omega \rightarrow \pi^0\gamma) = (8.5 \pm 0.5) \times 10^{-2}$.
⁸ Reanalysis of DRUZHININ 84, DOLINSKY 89, DOLINSKY 91 taking into account the triangle anomaly contributions.

PARAMETER Λ IN $\omega \rightarrow \pi^0\ell^+\ell^-$ DECAY

In the pole approximation the electromagnetic transition form factor for a resonance of mass M is given by the expression:

$$|F|^2 = (1 - M^2/\Lambda^2)^{-2},$$

where the parameter Λ vector dominance predicts $\Lambda = M_p \approx 0.770$ GeV. The ARNALDI 09 measurement is in obvious conflict with this expectation. Note that for $\eta \rightarrow \gamma\mu^+\mu^-$ decay ARNALDI 09 and DZHELYADIN 80 obtain the value of Λ consistent with vector dominance.

[a] C parity forbids this to occur as a single-photon process.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, 2 combinations of partial widths obtained from integrated cross section, and 19 branching ratios uses 51 measurements and one constraint to determine 9 parameters. The overall fit has a $\chi^2 = 69.4$ for 43 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

- Using η and η' branching fractions from PDG 14.

 $\eta'(958) \Gamma(i)\Gamma(\gamma\gamma)/\Gamma(\text{total})$

This combination of a partial width with the partial width into $\gamma\gamma$ and with the total width is obtained from the integrated cross section into channel(i) in the $\gamma\gamma$ annihilation.

$\Gamma(\gamma\gamma) \times \Gamma(\rho^0\gamma$ (including non-resonant $\pi^+\pi^-\gamma$))/ Γ_{total}	$\Gamma_7\Gamma_2/\Gamma$

 $\eta'(958) \rightarrow \eta\pi\pi$ DECAY PARAMETERS

$$|\text{MATRIX ELEMENT}|^2 = |1 + \alpha Y|^2 + CX + DX^2$$

X and Y are Dalitz variables; α is complex and C , and D are real-valued. Parameters C and D are not necessarily equal to c and d , respectively, in the generalized parameterization following this one. May be different for $\eta'(958) \rightarrow \eta\pi^+\pi^-$ and $\eta'(958) \rightarrow \eta\pi^0\pi^0$ decays. Because of different initial assumptions and strong correlations of the parameters we do not average the parameters in the section below.

- 1 From the $D^\pm \rightarrow K^\pm K^+ K^-$ Dalitz plot fit with the Triple-M amplitude in the multi-meson model of AOUDE 18.
- 2 Quoted number refers to real part of pole position.
- 3 Analytic continuation using Roy equations. Uses the K_{e4} data of BATLEY 10c and the $\pi N \rightarrow \pi \pi N$ data of HYAMS 73, GRAYER 74, and PROTOPODESCU 73.
- 4 Analytic continuation using GKPY equations. Uses the K_{e4} data of BATLEY 10c and the $\pi N \rightarrow \pi \pi N$ data of HYAMS 73, GRAYER 74, and PROTOPODESCU 73.
- 5 Pole position. Used Roy equations.
- 6 Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08a, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82b.
- 7 On sheet II in a 2-pole solution. The other pole is found on sheet III at (850–100i) MeV
- 8 Using a relativistic Breit-Wigner function and taking into account the finite D_S mass.
- 9 Breit-Wigner mass. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio $g_{f_0} K K / g_{f_0} \pi \pi = 0$.
- 10 In the kaon-loop fit.
- 11 In the no-structure fit.
- 12 Systematic errors not estimated.
- 13 FLATTE 76 parameterization. $g_{f_0} \pi \pi = 329 \pm 96$ MeV/c² assuming $g_{f_0} K \bar{K} / g_{f_0} \pi \pi = 2$.
- 14 Breit-Wigner mass. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio $g_{f_0} K K / g_{f_0} \pi \pi = 4.21 \pm 0.25 \pm 0.21$ from ABLIKIM 05.
- 15 In the kaon-loop fit following formalism of ACHASOV 89.
- 16 In the no-structure fit assuming a direct coupling of ϕ to $f_0 \gamma$.
- 17 FLATTE 76 parameterization. Supersedes GARMASH 05.
- 18 FLATTE 76 parameterization. $g_{f_0} K \bar{K} / g_{f_0} \pi \pi = 4.21 \pm 0.25 \pm 0.21$.
- 19 K-matrix pole from combined analysis of $\pi^- p \rightarrow \pi^0 \pi^0 n, \pi^- p \rightarrow K \bar{K} n, \pi^+ \pi^- \rightarrow \pi^+ \pi^-, \bar{p} p \rightarrow \pi^0 \pi^0 \pi^0, \pi^0 \eta n, \pi^0 \pi^0 \eta, \pi^+ \pi^- \pi^0, K^+ K^- \pi^0, K_S^0 K_S^0 \pi^0, K^+ K_S^0 \pi^-$ at rest, $\bar{p} n \rightarrow \pi^- \pi^- \pi^+, K_S^0 K^- \pi^0, K_S^0 K_S^0 \pi^-$ at rest.
- 20 From the negative interference with the $f_0(500)$ meson of AITALA 01b using the ACHASOV 89 parameterization for the $f_0(980)$, a Breit-Wigner for the $f_0(500)$, and ACHASOV 01f for the $\rho \pi$ contribution.
- 21 Coupled-channel Breit-Wigner, couplings $g_{\pi\pi} = 0.09 \pm 0.01 \pm 0.01, g_{K\pi} = 0.02 \pm 0.04 \pm 0.03$.
- 22 Supersedes ACHASOV 98i. Using the model of ACHASOV 89.
- 23 Supersedes ACHASOV 98i.
- 24 In the "narrow resonance" approximation.
- 25 Assuming $\Gamma(f_0) = 40$ MeV.
- 26 From a narrow pole fit taking into account $f_0(980)$ and $f_0(1200)$ intermediate mechanisms.
- 27 From the combined fit of the photon spectra in the reactions $e^+ e^- \rightarrow \pi^+ \pi^- \gamma, \pi^0 \pi^0 \gamma$.
- 28 Supersedes BARBERIS 99 and BARBERIS 99b
- 29 T-matrix pole.
- 30 From invariant mass fit.
- 31 On sheet II in a 2 pole solution. The other pole is found on sheet III at (1039–93i) MeV.
- 32 On sheet II in a 2 pole solution. The other pole is found on sheet III at (963–29i) MeV.
- 33 Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
- 34 At high $|t|$.
- 35 At low $|t|$.
- 36 On sheet II in a 4-pole solution, the other poles are found on sheet III at (953–55i) MeV and on sheet IV at (938–35i) MeV.
- 37 Combined fit of ALDE 95b, ANISOVICH 94, AMSLER 94d.
- 38 On sheet II in a 2 pole solution. The other pole is found on sheet III at (996–103i) MeV.
- 39 From sheet II pole position.
- 40 On sheet II in a 2 pole solution. The other pole is found on sheet III at (797–185i) MeV and can be interpreted as a shadow pole.
- 41 On sheet II in a 2 pole solution. The other pole is found on sheet III at (978–28i) MeV.
- 42 From coupled channel analysis.
- 43 Coupled channel analysis with finite width corrections.
- 44 Included in AGUILAR-BENITEZ 78 fit.

$f_0(980)$ WIDTH

Width determination very model dependent. Peak width in $\pi \pi$ is about 50 MeV, but decay width can be much larger.

- 1 Analytic continuation using Roy equations. Uses the K_{e4} data of BATLEY 10c and the $\pi N \rightarrow \pi \pi N$ data of HYAMS 73, GRAYER 74, and PROTOPODESCU 73.
- 2 Quoted number refers to twice imaginary part of pole position.
- 3 Analytic continuation using GKPY equations. Uses the K_{e4} data of BATLEY 10c and the $\pi N \rightarrow \pi \pi N$ data of HYAMS 73, GRAYER 74, and PROTOPODESCU 73.
- 4 Pole position. Used Roy equations.
- 5 Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08a, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82b.
- 6 On sheet II in a 2-pole solution. The other pole is found on sheet III at (850–100i) MeV
- 7 Using a relativistic Breit-Wigner function and taking into account the finite D_S mass.
- 8 Breit-Wigner $\pi \pi$ width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio $g_{f_0} K K / g_{f_0} \pi \pi = 0$.
- 9 Systematic errors not estimated.

See key on page 999

Meson Particle Listings
f_0(980)

- 10 Breit-Wigner pi-pi width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio g_f0 K K / g_f0 pi pi = 4.21 +/- 0.25 +/- 0.21 from ABLIKIM 05.
11 Breit-Wigner, solution 1, PWA ambiguous.
12 K-matrix pole from combined analysis of pi-p rho -> pi^0 pi^0 n, pi-p rho -> K Kbar n, pi+ pi- -> pi+ pi-, p pbar -> pi^0 pi^0 pi^0, pi^0 eta, pi^0 pi^0 eta, pi+ pi- pi^0, K+ K- pi^0, K_S^0 K_S^0 pi^0, K+ K_S^0 pi- at rest, p n -> pi- pi- pi+, K_S^0 K- pi^0, K_S^0 K_S^0 pi- at rest.
13 Using the data of AKHMETSHIN 99c, ACHASOV 00H, and ALOISIO 02D.
14 Breit-Wigner width.
15 Supersedes ACHASOV 98i. Using the model of ACHASOV 89.
16 Supersedes ACHASOV 98i.
17 In the "narrow resonance" approximation.
18 From the combined fit of the photon spectra in the reactions e+ e- -> pi+ pi- gamma, pi^0 pi^0 gamma.
19 Supersedes BARBERIS 99 and BARBERIS 99b
20 T-matrix pole.
21 On sheet II in a 2 pole solution. The other pole is found on sheet III at (1039-93i) MeV.
22 From invariant mass fit.
23 On sheet II in a 2 pole solution. The other pole is found on sheet III at (963-29i) MeV.
24 Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
25 At high |t|.
26 At low |t|.
27 On sheet II in a 4-pole solution, the other poles are found on sheet III at (953-55i) MeV and on sheet IV at (938-35i) MeV.
28 Combined fit of ALDE 95B, ANISOVICH 94,
29 On sheet II in a 2 pole solution. The other pole is found on sheet III at (996-103i) MeV.
30 From sheet II pole position.
31 On sheet II in a 2 pole solution. The other pole is found on sheet III at (797-185i) MeV and can be interpreted as a shadow pole.
32 On sheet II in a 2 pole solution. The other pole is found on sheet III at (978-28i) MeV.
33 From coupled channel analysis.
34 Coupled channel analysis with finite width corrections.
35 From coupled channel fit to the HYAMS 73 and PROTOPODESCU 73 data. With a simultaneous fit to the pi-pi phase-shifts, inelasticity and to the K_S^0 K_S^0 invariant mass.
36 Included in AGUILAR-BENITEZ 78 fit.

f_0(980) DECAY MODES

Table with 3 columns: Mode, Fraction (Gamma_i / Gamma), and description. Rows include pi pi, K Kbar, gamma gamma, and e+ e-.

f_0(980) PARTIAL WIDTHS

Table with 5 columns: Gamma(gamma), VALUE (keV), DOCUMENT ID, TECN, COMMENT, and Gamma_3. Includes OUR AVERAGE and various experimental data points with footnotes 1-13.

Gamma(e+ e-) table with columns: VALUE (eV), CL%, DOCUMENT ID, TECN, COMMENT, and Gamma_4. Value is <8.4, CL% is 90, DOCUMENT ID is VOROBYEV 88, TECN is ND, COMMENT is e+ e- -> pi^0 pi^0.

f_0(980) BRANCHING RATIOS

Gamma(pi pi) / [Gamma(pi pi) + Gamma(K Kbar)] table with columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT, and Gamma_1 / (Gamma_1 + Gamma_2). Includes values like 0.52 +/- 0.12, 0.75 +/- 0.11, 0.84 +/- 0.02, ~0.68, 0.67 +/- 0.09, 0.81 +/- 0.09, 0.78 +/- 0.03.

- 1 Recalculated by us using Gamma(K+ K-) / Gamma(pi+ pi-) = 0.69 +/- 0.32 from AUBERT 06o and isospin relations.
2 Using data from ABLIKIM 04g.
3 From a combined K-matrix analysis of Crystal Barrel (0. rho rho -> pi^0 pi^0 pi^0, pi^0 eta, pi^0 pi^0 eta), GAMS (pi rho -> pi^0 pi^0 n, eta eta, eta eta), and BNL (pi rho -> K Kbar n) data.
4 Measure pi-pi elasticity assuming two resonances coupled to the pi-pi and K Kbar channels only.

¹ Using the model of ACHASOV 89 and ACHASOV 03b.
² From a fit with the S-wave amplitude including two interfering Breit-Wigners plus a background term.
³ Parameterizes couplings to $\bar{K}K, \pi\eta$, and $\pi\eta'$.
⁴ Using AMSLER 94d and ABELE 98.
⁵ From the T-matrix pole on sheet II.
⁶ Using the model of ACHASOV 89. Supersedes ACHASOV 98b.
⁷ Using the model of JAFFE 77. Supersedes ACHASOV 98b.
⁸ T-matrix pole.
⁹ Breit-Wigner fit, average between a_0^\pm and a_0^0 . The fit favors a slightly heavier a_0^\pm .
¹⁰ From a single Breit-Wigner fit.
¹¹ From $f_1(1285)$ decay.

1019.9 ±0.3	410	STOTTLE...	71	HBC	$2.9 K^- p \rightarrow \Sigma / \Lambda K \bar{K}$

- Average of KOZYREV 16 and KOZYREV 18 values taking into account the correlated uncertainties. Supersedes individual KOZYREV 16 and KOZYREV 18 results.
- Using a vector meson dominance model with contribution from $\phi(1020)$ and higher mass excitations of $\rho(770)$, $\omega(782)$, and $\phi(1020)$.
- Using a phenomenological model based on KUHN 90 with a sum of Breit-Wigner resonances for $\rho(770)$, $\omega(782)$, $\phi(1020)$ and their higher mass excitations.
- Update of AKHMETSHIN 99b
- From the combined fit assuming that the total $\phi(1020)$ production cross section is saturated by those of $K^+ K^-$, $K_S K_L$, $\pi^+ \pi^- \pi^0$, and $\eta \gamma$ decays modes and using ACHASOV 00b for the $\eta \gamma$ decay mode.
- Using a total width of 4.43 ± 0.05 MeV. Systematic uncertainty included.
- Using a total width of 4.43 ± 0.05 MeV.
- PELLINEN 82 review includes AKERLOF 77, DAUM 81, BALDI 77, AYRES 74, DE-GROOT 74.
- From the $D^\pm \rightarrow K^\pm K^+ K^-$ Dalitz plot fit with the Triple-M amplitude in the multi-meson model of AOUDE 18.
- Strongly correlated with AKHMETSHIN 04.
- Systematic errors not evaluated.
- Weighted and scaled average of 12 measurements of DIJKSTRA 86.
- Mass errors enlarged by us to Γ/\sqrt{N} ; see the note with the $K^*(892)$ mass.

- Average of KOZYREV 16 and KOZYREV 18 values taking into account the correlated uncertainties. Supersedes individual KOZYREV 16 and KOZYREV 18 results.
- Using a vector meson dominance model with contribution from $\phi(1020)$ and higher mass excitations of $\rho(770)$, $\omega(782)$, and $\phi(1020)$.
- Using a phenomenological model based on KUHN 90 with a sum of Breit-Wigner resonances for $\rho(770)$, $\omega(782)$, $\phi(1020)$ and their higher mass excitations.
- Update of AKHMETSHIN 99b
- From the combined fit assuming that the total $\phi(1020)$ production cross section is saturated by those of $K^+ K^-$, $K_S K_L$, $\pi^+ \pi^- \pi^0$, and $\eta \gamma$ decays modes and using ACHASOV 00b for the $\eta \gamma$ decay mode.
- Width errors enlarged by us to $4\Gamma/\sqrt{N}$; see the note with the $K^*(892)$ mass.
- Strongly correlated with AKHMETSHIN 04.
- Systematic errors not evaluated.

CONSTRAINED FIT INFORMATION

An overall fit to 30 branching ratios uses 82 measurements and one constraint to determine 14 parameters. The overall fit has a $\chi^2 = 63.7$ for 69 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

¹ The prediction taking into account phase-space difference, radiative corrections, isospin breaking, and the Sommerfeld-Gamow-Sakharov factor gives 0.630.
² Theoretical analysis of BRAMON 00 taking into account phase-space difference, electromagnetic radiative corrections, as well as isospin breaking, predicts 0.62. FLOREZ-BAEZ 08 predicts 0.63 considering also structure-dependent radiative corrections. FISCHBACH 02 calculates additional corrections caused by the close threshold and predicts 0.68. See also BENAYOUN 01 and DUBYNSKIY 07. BENAYOUN 12 obtains 0.71 ± 0.01 in the HLS model.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹ Obtained by the authors taking into account the $\pi^+\pi^-$ decay mode. Includes a component due to $\pi\pi$ production via the $f_0(500)$ meson. Supersedes ALOISIO 02D.
- ² From the combined fit of the photon spectra in the reactions $e^+e^- \rightarrow \pi^+\pi^-\gamma, \pi^0\pi^0\gamma$.
- ³ From the negative interference with the $f_0(500)$ meson of AITALA 01B using the ACHASOV 89 parameterization for the $f_0(980)$, a Breit-Wigner for the $f_0(500)$, and ACHASOV 01F for the $\rho\pi$ contribution. Superseded by AMBROSINO 07.
- ⁴ Assuming that the $\pi^0\pi^0\gamma$ final state is completely determined by the $f_0\gamma$ mechanism, neglecting the decay $B(\phi \rightarrow K\bar{K}\gamma)$ and using $B(f_0 \rightarrow \pi^+\pi^-) = 2B(f_0 \rightarrow \pi^0\pi^0)$.

⁵ Using the value $B(\phi \rightarrow \eta\gamma) = (1.338 \pm 0.053) \times 10^{-2}$.

⁶ For $E_\gamma > 20$ MeV. Supersedes AKHMETSHIN 97c.

⁷ Neglecting other intermediate mechanisms ($\rho\pi, \sigma\gamma$).

⁸ A narrow pole fit taking into account $f_0(980)$ and $f_0(1200)$ intermediate mechanisms.

⁹ For destructive interference with the Bremsstrahlung process

¹⁰ For constructive interference with the Bremsstrahlung process

$-16 < a_1 < 11$ 90 9.8k ^{1,4}AKHMETSHIN 98 CMD2 $e^+ e^- \rightarrow \pi^+ \pi^- \gamma\gamma$

¹ Dalitz plot analysis taking into account interference between the contact and $\rho\pi$ amplitudes.
² From a fit without limitations on charged and neutral ρ masses and widths.
³ Recalculated by us to match the notations of AKHMETSHIN 98.
⁴ Assuming zero phase for the contact term.

PARAMETER β IN $\phi \rightarrow P e^+ e^-$ DECAYS

In the one-pole approximation the electromagnetic transition form factor for $\phi \rightarrow P e^+ e^-$ ($P = \pi, \eta$) is given as a function of the $e^+ e^-$ invariant mass squared, q^2 , by the expression:

$$|F(q^2)|^2 = (1 - q^2/\Lambda^2)^{-2},$$

where vector meson dominance predicts parameter $\Lambda \approx 0.770$ GeV ($\Lambda^{-2} \approx 1.687$ GeV⁻²). The slope of this form factor, $\beta = dF/dq^2 (q^2=0)$, equals Λ^{-2} in this approximation.

The measurements below obtain β in the one-pole approximation.

PARAMETER β IN $\phi \rightarrow \pi^0 e^+ e^-$ DECAY

- Statistical error negligible.
- From the pole position. Using an amplitude analysis based on approximate three-body unitary of τ data from SCHAEEL 05c.
- Reanalysis of CLEO data using Breit-Wigner parameterization.
- Superseded by AGHASYAN 2018B.
- The $\rho^\pm \pi^\mp$ state can be also due to the $\pi(1300)$.
- Using the Breit-Wigner parameterization; strong correlation between mass and width.
- Using the data of BARATE 98R.
- From a fit to the 3π mass spectrum including the $K\bar{K}^*(892)$ threshold.
- Uses the model of KUHN 90.
- Uses the model of ISGUR 89.
- Includes the effect of a possible a_1' state.
- Uses the model of FEINDT 90.
- Supersedes AKERS 95P.
- Average and spread of values using 2 variants of the model of BOWLER 75.
- Reanalysis of RUCKSTUHL 86.
- Reanalysis of SCHMIDKE 86.
- Reanalysis of ALBRECHT 86B.
- From a combined reanalysis of ALBRECHT 86B, SCHMIDKE 86, and RUCKSTUHL 86.
- From a combined reanalysis of ALBRECHT 86B and DAUM 81B.
- Uses the model of BOWLER 75.
- Produced in K^- backward scattering.

- From a fit to the Dalitz plot.
- Assuming for $\rho(1450)$ mass and width of 1370 and 386 MeV respectively.
- Assuming for $f_0(500)$ (σ) mass and width of 860 and 880 MeV respectively.
- Uses multichannel Aitchison-Bowler model (BOWLER 75). Uses data from GAVILLET 77, DAUM 80, and DANKOWYCH 81.
- Assuming for $f_0(1370)$ mass and width of 1186 and 350 MeV respectively.
- Assuming for $f_2(1270)$ mass and width of 1275 and 185 MeV respectively.
- Inconsistent with observations of $\sigma\pi$, $f_0(1370)\pi$, and $f_2(1270)\pi$ decay modes.
- Using structure functions from KUHN 92 and DECKER 93A and B ($\tau^- \rightarrow K^- \pi^- K^+ \nu_\tau$) = (0.155 \pm 0.006 \pm 0.009)% from BRIERE 03.
- From a comparison to ALAM 94 assuming purely resonant production of the $K^- K^+ \pi^0$ system.
- From a fit to the 3π mass spectrum including the $K \bar{K}^*(892)$ threshold.
- Assuming $a_1(1260)$ dominance and taking B($\tau \rightarrow a_1(1260)\nu_\tau$) from BUSKULIC 96.

- Averaged over six nuclear targets, no statistically significant dependence on target nucleus observed.
- Breit-Wigner mass.
- T-matrix pole.
- Mass errors enlarged by us to Γ/\sqrt{N} ; see the note with the $K^*(892)$ mass.
- From a partial-wave analysis of data using a K-matrix formalism with 5 poles.
- From an energy-independent partial-wave analysis.
- From an amplitude analysis of the reaction $\pi^+\pi^- \rightarrow 2\pi^0$.
- From an amplitude analysis of $\pi^+\pi^- \rightarrow \pi^+\pi^-$ scattering data.
- Using CLEO-c data but not authored by the CLEO Collaboration.
- From a fit to a Breit-Wigner line shape with fixed $\Gamma = 185$ MeV.
- 4-poles, 5-channel K matrix fit.
- From analysis of L3 data at 91 and 183-209 GeV.
- Systematic uncertainties not estimated.
- JOHNSON 68 includes BONDAR 63, LEE 64, DERADO 65, EISNER 67.

WEIGHTED AVERAGE
185.9±2.8-2.1 (Error scaled by 1.6)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

$f_2(1270)$ width (MeV)

CONSTRAINED FIT INFORMATION

An overall fit to the total width, 4 partial widths, a combination of partial widths obtained from integrated cross sections, and 6 branching ratios uses 45 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 83.0$ for 38 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

• • • We do not use the following data for averages, fits, limits, etc. • • •					
<1.7	90	VOROBYEV	88	ND	$e^+e^- \rightarrow \pi^0\pi^0$

- From a partial-wave analysis of data using a K-matrix formalism with 5 poles.
- From analysis of L3 data at 91 and 183–209 GeV and using SU(3) relations.
- Based on a K-matrix analysis of BELLE data from MORI 07, UEHARA 08a, UEHARA 09 and UEHARA 13. The width is derived for the pole on the third sheet which is closest to the physical axis. Supersedes PENNINGTON 08.
- Solution A (preferred solution based on χ^2 -analysis).
- Dispersion theory based amplitude analysis of BOYER 90, MARSISKE 90, BEHREND 92, and MORI 07.
- Solution B (worse than solution A; still acceptable when systematic uncertainties are included).
- With a narrow scalar state around 1220 MeV.
- Using a unitarized model with a 300–500 keV wide scalar at 1100 MeV.
- Using the unitarized model of LYTH 85.
- Error includes spread of different solutions. Data of MARK2 and CRYSTAL BALL used in the analysis. Authors report strong correlations with $\gamma\gamma$ width of $f_0(1370)$: $\Gamma(f_2) + 1/4 \Gamma(f_0) = 3.6 \pm 0.3$ KeV.
- Radiative corrections modify the partial widths; for instance the COURAU 84 value becomes 2.66 ± 0.21 in the calculation of LANDRO 86.
- Using the MENNESSIER 83 model.
- Superseded by BOYER 90.
- If helicity = 2 assumption is not made.
- Using mass, width and $B(f_2(1270) \rightarrow 2\pi)$ from PDG 78.

 $f_1(1285)$

CONSTRAINED FIT INFORMATION

An overall fit to 6 branching ratios uses 18 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 24.0$ for 14 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 18 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 9.3$ for 15 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

1256	FROGGATT 77 RVUE $\pi^+ \pi^-$ channel

¹ Breit-Wigner mass.

² Breit-Wigner mass. May also be the $f_0(1500)$.

³ Reanalysis of ABELE 96c data.

⁴ Also observed by GARMASH 07 in $B^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays. Supersedes GARMASH 05.

⁵ Uses data from BEIER 72b, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CASON 83, ASTON 88, and ARMSTRONG 91b. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.

⁶ Also observed by ASNER 00 in $\tau^- \rightarrow \pi^- \pi^0 \pi^0 \nu_\tau$ decays

- • • We do not use the following data for averages, fits, limits, etc. • • •
- These experiments identify only one pseudoscalar in the 1400–1500 range. Data could also refer to $\eta(1475)$.
 - Systematic uncertainty not evaluated.
 - From best fit to 0^{-+} partial wave, 50% $K^*(892) K$, 50% $a_0(980) \pi$.

1 Constructive interference between $X(1835)$ and $\eta(1405)/\eta(1475)$ decays to $\gamma\phi$ is assumed. Also see $\eta(1475)$. ABLIKIM 181 reports the inverse as 11.10 ± 3.5 .

2 Destructive interference between $X(1835)$ and $\eta(1405)/\eta(1475)$ decays to $\gamma\phi$ is assumed. Also see $\eta(1475)$. ABLIKIM 181 reports the inverse as 7.53 ± 2.49 .

3 Calculated by us from $B(J/\psi \rightarrow \eta(1405)\gamma \rightarrow \phi\gamma\gamma) < 0.82 \times 10^{-4}$ and $B(J/\psi \rightarrow \eta(1405)\gamma \rightarrow \rho^0\gamma\gamma) = (1.07 \pm 0.17 \pm 0.11) \times 10^{-4}$.

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹ From a fit with a width fixed at 55 MeV.
² This result supersedes ARMSTRONG 84, ARMSTRONG 89.
³ From fit to the $K^*(892) K 1^+ +$ partial wave.
⁴ Mass error increased to account for $a_0(980)$ mass cut uncertainties.
⁵ No systematic error given.

f₁(1420) WIDTH

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes sub-sections for Γ(ππ)/Γ(KK̄π) and Γ(ηππ)/Γ(KK̄π). Contains data for various experiments like ABDALLAH, NICHITIU, ADAMS, BARBERIS, BERTIN, ARMSTRONG, AUGUSTIN, BAI, BEHREND, BECKER, AIHARA, CHAUVAT, BROMBERG, DIONISI, DAHL, SOSA, PROKOSHKIN, BITYUKOV.

6 This result supersedes ARMSTRONG 84, ARMSTRONG 89.
7 From fit to the K*(892) K 1++ partial wave.
8 No systematic error given.

f₁(1420) DECAY MODES

Table with columns: Mode, Fraction (Γ_i/Γ). Lists decay modes like K K̄ π, K K*(892) + c.c., η π π, a₀(980) π, π π ρ, 4 π, ρ⁰ γ, φ γ.

f₁(1420) Γ(i)Γ(γγ)/Γ(total)

Table with columns: VALUE (keV), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Includes sub-section Γ(KK̄π) × Γ(γγ*)/Γ_{total}.

9 From a fit with a width fixed at 55 MeV.
10 The form factor parameter from the fit is 926 ± 78 MeV.
11 Assume a ρ-pole form factor.
12 A φ - pole form factor gives considerably smaller widths.
13 Published value divided by 2.

f₁(1420) BRANCHING RATIOS

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Includes sub-section Γ(KK*(892) + c.c.)/Γ(KK̄π).

Γ(ππ)/Γ(KK̄π)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for CORDEN, DAHL.

Γ(ηππ)/Γ(KK̄π)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for ARMSTRONG, KOPKE, GIDAL, CORDEN, DEFOIX.

Γ(a₀(980)π)/Γ(ηππ)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for PROKOSHKIN, ANDO, CORDEN, DEFOIX.

Γ(4π)/Γ(KK*(892) + c.c.)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for DIONISI.

Γ(KK̄π)/[Γ(KK*(892) + c.c.) + Γ(a₀(980)π)]

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Includes data for DIONISI.

Γ(a₀(980)π)/Γ(KK*(892) + c.c.)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for BARBERIS, ARMSTRONG.

Γ(4π)/Γ(KK̄π)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for ARMSTRONG.

Γ(ρ⁰γ)/Γ_{total}

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for ARMSTRONG.

Γ(ρ⁰γ)/Γ(KK̄π)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for BARBERIS.

Γ(φγ)/Γ(KK̄π)

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Includes data for BARBERIS.

 $\rho(1450)$

$$I^G(J^{PC}) = 1^+(1^-)$$

THE $\rho(1450)$ AND THE $\rho(1700)$

Updated September 2019 by S. Eidelman (Novosibirsk), C. Hanhart (Juelich) and G. Venanzoni (Pisa).

In our 1988 edition, we replaced the $\rho(1600)$ entry with two new ones, the $\rho(1450)$ and the $\rho(1700)$, because there was emerging evidence that the 1600-MeV region actually contains two ρ -like resonances. Erkal [1] had pointed out this possibility with a theoretical analysis on the consistency of 2π and 4π electromagnetic form factors and the $\pi\pi$ scattering length. Donnachie [2], with a full analysis of data on the 2π and 4π final states in e^+e^- annihilation and photoproduction reactions, had also argued that in order to obtain a consistent picture, two resonances were necessary. The existence of $\rho(1450)$ was supported by the analysis of $\eta\rho^0$ mass spectra obtained in photoproduction and e^+e^- annihilation [3], as well as that of $e^+e^- \rightarrow \omega\pi$ [4].

The analysis of [2] was further extended by [5,6] to include new data on 4π -systems produced in e^+e^- annihilation, and in τ -decays (τ decays to 4π , and e^+e^- annihilation to 4π can be related by the Conserved Vector Current assumption). These systems were successfully analyzed using interfering contributions from two ρ -like states, and from the tail of the $\rho(770)$ decaying into two-body states. While specific conclusions on $\rho(1450) \rightarrow 4\pi$ were obtained, little could be said about the $\rho(1700)$.

Independent evidence for two 1^- states is provided by [7] in 4π electroproduction at $\langle Q^2 \rangle = 1$ (GeV/c)², and by [8] in a high-statistics sample of the $\eta\pi\pi$ system in π^-p charge exchange.

This scenario with two overlapping resonances is supported by other data. Bisello [9] measured the pion form factor in the interval 1.35–2.4 GeV, and observed a deep minimum around 1.6 GeV. The best fit was obtained with the hypothesis of ρ -like resonances at 1420 and 1770 MeV, with widths of about 250 MeV. Antonelli [10] found that the $e^+e^- \rightarrow \eta\pi^+\pi^-$ cross section is better fitted with two fully interfering Breit-Wigners, with parameters in fair agreement with those of [2] and [9]. These results can be considered as a confirmation of the $\rho(1450)$.

Decisive evidence for the $\pi\pi$ decay mode of both $\rho(1450)$ and $\rho(1700)$ comes from $\bar{p}p$ annihilation at rest [11]. It has been shown that these resonances also possess a $K\bar{K}$ decay mode [12–14]. High-statistics studies of the decays $\tau \rightarrow \pi\pi\nu_\tau$ [15,16], and $\tau \rightarrow 4\pi\nu_\tau$ [17] also require the $\rho(1450)$, but are not sensitive to the $\rho(1700)$, because it is too close to the τ mass. A recent very-high-statistics study of the $\tau \rightarrow \pi\pi\nu_\tau$ decay performed at Belle [18] reports the first observation of both $\rho(1450)$ and $\rho(1700)$ in τ decays. A clear picture of the two $\pi^+\pi^-$ resonances interfering with the $\rho(770)$ in e^+e^- annihilation was also reported by BaBar using the ISR method [19].

The structure of these ρ states is not yet completely clear. Barnes [20] and Close [21] claim that $\rho(1450)$ has a mass

consistent with radial $2S$, but its decays show characteristics of hybrids, and suggest that this state may be a $2S$ -hybrid mixture. Donnachie [22] argues that hybrid states could have a 4π decay mode dominated by the $a_1\pi$. Such behavior has been observed by [23] in $e^+e^- \rightarrow 4\pi$ in the energy range 1.05–1.38 GeV, and by [17] in $\tau \rightarrow 4\pi$ decays. CLEO [24] and Belle [25] observe the $\rho(1450) \rightarrow \omega\pi$ decay mode in B -meson decays, however, do not find $\rho(1700) \rightarrow \omega\pi^0$. A similar conclusion is made by [26,27], who studied the process $e^+e^- \rightarrow \omega\pi^0$ and do not observe a statistically significant signal of the $\rho(1700)$. Various decay modes of the $\rho(1450)$ and $\rho(1700)$ are observed in $\bar{p}n$ and $\bar{p}p$ annihilation [28,29], but no definite conclusions can be drawn. More data should be collected to clarify the nature of the ρ states, particularly in the energy range above 1.6 GeV.

We now list under a separate entry the $\rho(1570)$, the $\phi\pi$ state with $J^{PC} = 1^{--}$ earlier observed by [30] (referred to as $C(1480)$) and recently confirmed by [31]. While [32] shows that it may be a threshold effect, [5] and [33] suggest two independent vector states with this decay mode. The $C(1480)$ has not been seen in the $\bar{p}p$ [34] and e^+e^- [35,36] experiments. However, the sensitivity of the two latter is an order of magnitude lower than that of [31]. Note that [31] can not exclude that their observation is due to an OZI-suppressed decay mode of the $\rho(1700)$.

Several observations on the $\omega\pi$ system in the 1200-MeV region [37–43] may be interpreted in terms of either $J^P = 1^-$ $\rho(770) \rightarrow \omega\pi$ production [44], or $J^P = 1^+$ $b_1(1235)$ production [42,43]. We argue that no special entry for a $\rho(1250)$ is needed. The LASS amplitude analysis [45] showing evidence for $\rho(1270)$ is preliminary and needs confirmation. For completeness, the relevant observations are listed under the $\rho(1450)$.

Recently [46] reported a very broad 1^{--} resonance-like K^+K^- state in $J/\psi \rightarrow K^+K^-\pi^0$ decays. Its pole position corresponds to mass of 1576 MeV and width of 818 MeV. [47–49] suggest its exotic structure (molecular or multiquark), while [50] and [51] explain it by the interference between the $\rho(1450)$ and $\rho(1700)$. The latter statement is qualitatively supported by BaBar [52] and SND [53]. We quote [46] as $X(1575)$ in the section “Further States.”

Evidence for ρ -like mesons decaying into 6π states was first noted by [54] in the analysis of 6π mass spectra from e^+e^- annihilation [55,56] and diffractive photoproduction [57]. Clegg [54] argued that two states at about 2.1 and 1.8 GeV exist: while the former is a candidate for the $\rho(2150)$, the latter could be a manifestation of the $\rho(1700)$ distorted by threshold effects. BaBar reported observations of the new decay modes of the $\rho(2150)$ in the channels $\eta'(958)\pi^+\pi^-$ and $f_1(1285)\pi^+\pi^-$ [58]. The relativistic quark model [59] predicts the 2^3D_1 state with $J^{PC} = 1^{--}$ at 2.15 GeV which can be identified with the $\rho(2150)$.

We no longer list under a separate particle $\rho(1900)$ various observations of irregular behavior of the cross sections near the $N\bar{N}$ threshold. Dips of various width around 1.9

GeV were reported by the E687 Collaboration (a narrow one in the $3\pi^+3\pi^-$ diffractive photoproduction [60,61]), by the FENICE experiment (a narrow structure in the R value [62]), by BaBar in ISR (a narrow structure in $e^+e^- \rightarrow \phi\pi$ final state [63], but much broader in $e^+e^- \rightarrow 3\pi^+3\pi^-$ and $e^+e^- \rightarrow 2(\pi^+\pi^-\pi^0)$ [64]), by CMD-3 (also a rather broad dip in $e^+e^- \rightarrow 3\pi^+3\pi^-$ [65]). A dedicated scan of the $N\bar{N}$ -threshold region by CMD-3 confirms this effect in the $e^+e^- \rightarrow 3\pi^+3\pi^-$ and $e^+e^- \rightarrow K^+K^-\pi^+\pi^-$ final states, but does not see it in the cross section of $e^+e^- \rightarrow 2\pi^+2\pi^-$ [66]. Most probably, these structures emerge as a threshold effect due to the opening of the $N\bar{N}$ channel [67,68,69].

 $f_0(1500)$

CONSTRAINED FIT INFORMATION

An overall fit to 6 branching ratios uses 10 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 5.6$ for 6 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

----------------------------------	----	----------------	------	---------------------------------

- From a partial-wave analysis of data using a K-matrix formalism with 5 poles.
- CHABAUD 81 is a reanalysis of PAWLICKI 77 data.
- From an amplitude analysis where the $f'_2(1525)$ width and elasticity are in complete disagreement with the values obtained from $K\bar{K}$ channel, making the solution dubious.
- Systematic errors not estimated.
- From partial wave analysis including all possible combinations of $0^{++}, 2^{++}$, and 4^{++} resonances.
- Supersedes ACCIARRI 95j.
- From an analysis including interference with $f_0(1710)$.
- Using CLEO-c data but not authored by the CLEO Collaboration.
- From a fit to a Breit-Wigner line shape with fixed $\Gamma = 73$ MeV.
- From a fit to a Breit-Wigner line shape plus a second-order polynomial function. Systematic errors not evaluated.
- From analysis of L3 data at 91 and 183-209 GeV.
- From an analysis ignoring interference with $f_0(1710)$.
- T-matrix pole.
- 4-poles, 5-channel K matrix fit.
- In the SU(3) based model with a specific interference pattern of the $f_2(1270), a_2^0(1320)$, and $f'_2(1525)$ mesons incoherently added to the $f_0(1710)$ and non-resonant background.
- Systematic errors not estimated.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, 2 partial widths, a combination of partial widths obtained from integrated cross sections, and 3 branching ratios uses 17 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 18.2$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 6 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 1.9$ for 3 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

1 From a fit with coherent interference of the $\phi(1680)$ with a non-resonant contribution.2 Assuming the $K\bar{K}^*(892) + c.c.$ dynamics. Systematic uncertainties not estimated.3 Using a vector meson dominance model with contribution from $\phi(1020)$, $\phi(1680)$, and higher mass excitations of $\rho(770)$ and $\omega(782)$.4 Using events with $\pi\pi$ invariant mass less than 0.85 GeV.

5 From a fit with two incoherent Breit-Wigners.

6 From the simultaneous fit to the $K\bar{K}^*(892) + c.c.$ and $\phi\eta$ data from AUBERT 08B using the results of AUBERT 07AK.7 From the combined fit of AKHMETSHIN 03 and MANE 81 also including ρ, ω , and ϕ . Neither isospin nor flavor structure known.

8 Using data from IVANOV 81, BARKOV 87, BISELLO 88B, DOLINSKY 91, and ANTONELLI 92.

9 Using the data from BISELLO 91c.

10 Using BISELLO 88B and MANE 82 data.

11 From global fit including ρ, ω, ϕ and $\rho(1700)$ assume mass 1570 MeV and width 510 MeV for ρ radial excitation.12 From global fit of ρ, ω, ϕ and their radial excitations to channels $\omega\pi^+\pi^-, K^+K^-, K_S^0 K_L^0, K_S^0 K^\pm\pi^\mp$. Assume mass 1570 MeV and width 510 MeV for ρ radial excitations, mass 1570 and width 500 MeV for ω radial excitation.13 Fit to one channel only, neglecting interference with $\omega, \rho(1700)$.

- ¹ From a fit with coherent interference of the $\phi(1680)$ with a non-resonant contribution.
² Assuming the $K \bar{K}^*(892) + c.c.$ dynamics. Systematic uncertainties not estimated.
³ Using a vector meson dominance model with contribution from $\phi(1020)$, $\phi(1680)$, and higher mass excitations of $\rho(770)$ and $\omega(782)$.
⁴ Using events with $\pi\pi$ invariant mass less than 0.85 GeV.
⁵ From a fit with two incoherent Breit-Wigners.
⁶ From the simultaneous fit to the $K \bar{K}^*(892) + c.c.$ and $\phi\eta$ data from AUBERT 08s using the results of AUBERT 07AK.
⁷ From the combined fit of AKHMETSHIN 03 and MANE 81 also including ρ, ω , and ϕ . Neither isospin nor flavor structure known.
⁸ Using BISELLO 88b and MANE 82 data.
⁹ From global fit including ρ, ω, ϕ and $\rho(1700)$
¹⁰ From global fit of ρ, ω, ϕ and their radial excitations to channels $\omega\pi^+\pi^-, K^+K^-, K_S^0 K_L^0, K_S^0 K^\pm \pi^\mp$. Assume mass 1570 MeV and width 510 MeV for ρ radial excitations, mass 1570 and width 500 MeV for ω radial excitation.
¹¹ Fit to one channel only, neglecting interference with $\omega, \rho(1700)$.

15 Width errors enlarged by us to $4\Gamma/\sqrt{N}$; see the note with the $K^*(892)$ mass.
 16 Uses same data as HYAMS 75 and BECKER 79.
 17 From a phase shift solution containing a $f_2'(1525)$ width two times larger than the $K\bar{K}$ result.
 18 From phase-shift analysis. Error takes account of spread of different phase-shift solutions.

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 10 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 14.7$ for 7 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

 $\rho(1700)$

$$J^G(J^{PC}) = 1^+(1^{--})$$

THE $\rho(1450)$ AND THE $\rho(1700)$

Updated September 2019 by S. Eidelman (Novosibirsk), C. Hanhart (Juelich) and G. Venanzoni (Pisa).

In our 1988 edition, we replaced the $\rho(1600)$ entry with two new ones, the $\rho(1450)$ and the $\rho(1700)$, because there was emerging evidence that the 1600-MeV region actually contains two ρ -like resonances. Erkal [1] had pointed out this possibility with a theoretical analysis on the consistency of 2π and 4π electromagnetic form factors and the $\pi\pi$ scattering length. Donnachie [2], with a full analysis of data on the 2π and 4π final states in e^+e^- annihilation and photoproduction reactions, had also argued that in order to obtain a consistent picture, two resonances were necessary. The existence of $\rho(1450)$ was supported by the analysis of $\eta\rho^0$ mass spectra obtained in photoproduction and e^+e^- annihilation [3], as well as that of $e^+e^- \rightarrow \omega\pi$ [4].

The analysis of [2] was further extended by [5,6] to include new data on 4π -systems produced in e^+e^- annihilation, and in τ -decays (τ decays to 4π , and e^+e^- annihilation to 4π can be related by the Conserved Vector Current assumption). These systems were successfully analyzed using interfering contributions from two ρ -like states, and from the tail of the $\rho(770)$ decaying into two-body states. While specific conclusions on $\rho(1450) \rightarrow 4\pi$ were obtained, little could be said about the $\rho(1700)$.

Independent evidence for two 1^- states is provided by [7] in 4π electroproduction at $\langle Q^2 \rangle = 1$ (GeV/c)², and by [8] in a high-statistics sample of the $\eta\pi\pi$ system in π^-p charge exchange.

This scenario with two overlapping resonances is supported by other data. Bisello [9] measured the pion form factor in the interval 1.35–2.4 GeV, and observed a deep minimum around 1.6 GeV. The best fit was obtained with the hypothesis of ρ -like resonances at 1420 and 1770 MeV, with widths of about 250 MeV. Antonelli [10] found that the $e^+e^- \rightarrow \eta\pi^+\pi^-$ cross section is better fitted with two fully interfering Breit-Wigners, with parameters in fair agreement with those of [2] and [9]. These results can be considered as a confirmation of the $\rho(1450)$.

Decisive evidence for the $\pi\pi$ decay mode of both $\rho(1450)$ and $\rho(1700)$ comes from $\bar{p}p$ annihilation at rest [11]. It has been shown that these resonances also possess a $K\bar{K}$ decay mode [12–14]. High-statistics studies of the decays $\tau \rightarrow \pi\pi\nu_\tau$ [15,16], and $\tau \rightarrow 4\pi\nu_\tau$ [17] also require the $\rho(1450)$, but are not sensitive to the $\rho(1700)$, because it is too close to the τ mass. A recent very-high-statistics study of the $\tau \rightarrow \pi\pi\nu_\tau$ decay performed at Belle [18] reports the first observation of both $\rho(1450)$ and $\rho(1700)$ in τ decays. A clear picture of the two $\pi^+\pi^-$ resonances interfering with the $\rho(770)$ in e^+e^- annihilation was also reported by BaBar using the ISR method [19].

The structure of these ρ states is not yet completely clear. Barnes [20] and Close [21] claim that $\rho(1450)$ has a mass consistent with radial $2S$, but its decays show characteristics of hybrids, and suggest that this state may be a $2S$ -hybrid mixture. Donnachie [22] argues that hybrid states could have a 4π decay mode dominated by the $a_1\pi$. Such behavior has been observed by [23] in $e^+e^- \rightarrow 4\pi$ in the energy range 1.05–1.38 GeV, and by [17] in $\tau \rightarrow 4\pi$ decays. CLEO [24] and Belle [25] observe the $\rho(1450) \rightarrow \omega\pi$ decay mode in B -meson decays, however, do not find $\rho(1700) \rightarrow \omega\pi^0$. A similar conclusion is made by [26,27], who studied the process $e^+e^- \rightarrow \omega\pi^0$ and do not observe a statistically significant signal of the $\rho(1700)$. Various decay modes of the $\rho(1450)$ and $\rho(1700)$ are observed in $\bar{p}n$ and $\bar{p}p$ annihilation [28,29], but no definite conclusions can be drawn. More data should be collected to clarify the nature of the ρ states, particularly in the energy range above 1.6 GeV.

We now list under a separate entry the $\rho(1570)$, the $\phi\pi$ state with $J^{PC} = 1^{--}$ earlier observed by [30] (referred to as $C(1480)$) and recently confirmed by [31]. While [32] shows that it may be a threshold effect, [5] and [33] suggest two independent vector states with this decay mode. The $C(1480)$ has not been seen in the $\bar{p}p$ [34] and e^+e^- [35,36] experiments. However, the sensitivity of the two latter is an order of magnitude lower than that of [31]. Note that [31] can not exclude that their observation is due to an OZI-suppressed decay mode of the $\rho(1700)$.

Several observations on the $\omega\pi$ system in the 1200-MeV region [37–43] may be interpreted in terms of either $J^P = 1^- \rho(770) \rightarrow \omega\pi$ production [44], or $J^P = 1^+ b_1(1235)$ production [42,43]. We argue that no special entry for a $\rho(1250)$ is needed. The LASS amplitude analysis [45] showing evidence for $\rho(1270)$ is preliminary and needs confirmation.

For completeness, the relevant observations are listed under the $\rho(1450)$.

Recently [46] reported a very broad 1^{--} resonance-like K^+K^- state in $J/\psi \rightarrow K^+K^-\pi^0$ decays. Its pole position corresponds to mass of 1576 MeV and width of 818 MeV. [47–49] suggest its exotic structure (molecular or multiquark), while [50] and [51] explain it by the interference between the $\rho(1450)$ and $\rho(1700)$. The latter statement is qualitatively supported by BaBar [52] and SND [53]. We quote [46] as $X(1575)$ in the section “Further States.”

Evidence for ρ -like mesons decaying into 6π states was first noted by [54] in the analysis of 6π mass spectra from e^+e^- annihilation [55,56] and diffractive photoproduction [57]. Clegg [54] argued that two states at about 2.1 and 1.8 GeV exist: while the former is a candidate for the $\rho(2150)$, the latter could be a manifestation of the $\rho(1700)$ distorted by threshold effects. BaBar reported observations of the new decay modes of the $\rho(2150)$ in the channels $\eta'(958)\pi^+\pi^-$ and $f_1(1285)\pi^+\pi^-$ [58]. The relativistic quark model [59] predicts the 2^3D_1 state with $J^{PC} = 1^{--}$ at 2.15 GeV which can be identified with the $\rho(2150)$.

We no longer list under a separate particle $\rho(1900)$ various observations of irregular behavior of the cross sections near the $N\bar{N}$ threshold. Dips of various width around 1.9 GeV were reported by the E687 Collaboration (a narrow one in the $3\pi^+3\pi^-$ diffractive photoproduction [60,61]), by the FENICE experiment (a narrow structure in the R value [62]), by BaBar in ISR (a narrow structure in $e^+e^- \rightarrow \phi\pi$ final state [63], but much broader in $e^+e^- \rightarrow 3\pi^+3\pi^-$ and $e^+e^- \rightarrow 2(\pi^+\pi^-\pi^0)$ [64]), by CMD-3 (also a rather broad dip in $e^+e^- \rightarrow 3\pi^+3\pi^-$ [65]). A dedicated scan of the $N\bar{N}$ -threshold region by CMD-3 confirms this effect in the $e^+e^- \rightarrow 3\pi^+3\pi^-$ and $e^+e^- \rightarrow K^+K^-\pi^+\pi^-$ final states, but does not see it in the cross section of $e^+e^- \rightarrow 2\pi^+2\pi^-$ [66]. Most probably, these structures emerge as a threshold effect due to the opening of the $N\bar{N}$ channel [67,68,69].

¹ Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of LEES 12G and ABLIKIM 16c.

² Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of ACHASOV 06, AKHMETSIN 07, AUBERT 09as, and AMBROSINO 11a.

³ Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of FUJIKAWA 08.

⁴ From a Dalitz plot analysis in an isobar model with $\rho(1450)$ and $\rho(1700)$ masses and widths floating.

⁵ Using the KUHN 90 parametrization of the pion form factor, neglecting $\rho-\omega$ interference.

⁶ Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the $\rho(1450)$, $\rho(1700)$, and $\rho(2150)$ resonances as free parameters of the fit.

⁷ $|F_\pi(0)|^2$ fixed to 1.

⁸ From the GOUNARIS 68 parametrization of the pion form factor.

⁹ T-matrix pole.

¹⁰ From phase shift analysis of HYAMS 73 data.

¹¹ Simple relativistic Breit-Wigner fit with constant width.

¹² An additional 40 MeV uncertainty in both the mass and width is present due to the choice of the background shape.

¹³ Included in BECKER 79 analysis.

¹ From partial wave analysis including all possible combinations of 0^{++} , 2^{++} , and 4^{++} resonances.

² Spin 0 favored over spin 2.

³ In the SU(3) based model with a specific interference pattern of the $f_2(1270)$, $a_2^0(1320)$, and $f_2'(1525)$ mesons incoherently added to the $f_0(1710)$ and non-resonant background.

⁴ Breit-Wigner mass.

⁵ $J^P = 0^+$, supersedes by ARMSTRONG 89D.

⁶ Using CLEO-c data but not authored by the CLEO Collaboration.

⁷ From a fit to a Breit-Wigner line shape with fixed $\Gamma = 135$ MeV.

⁸ Systematic errors not estimated.

⁹ This state may be different from $f_0(1710)$, see CLOSE 05.

¹⁰ K-matrix pole, assuming $J^P = 0^+$, from combined analysis of $\pi^- p \rightarrow \pi^0 \pi^0 n$, $\pi^- p \rightarrow K\bar{K}n$, $\pi^+\pi^- \rightarrow \pi^+\pi^-$, $\bar{p}p \rightarrow \pi^0 \pi^0 \pi^0$, $\pi^0 \eta \eta$, $\pi^0 \pi^0 \eta$, $\pi^+\pi^-\pi^0$, $K^+ K^- \pi^0$, $K_S^0 K_S^0 \pi^0$, $K^+ K_S^0 \pi^-$ at rest, $\bar{p}n \rightarrow \pi^-\pi^-\pi^+$, $K_S^0 K^- \pi^0$, $K_S^0 K_S^0 \pi^-$ at rest.

¹¹ Decaying to $f_0(1370)\pi\pi$.

¹² T-matrix pole.

¹³ Not seen by AMSLER 02.

¹⁴ Supersedes BARBERIS 99 and BARBERIS 99B.

¹⁵ T-matrix pole, assuming $J^P = 0^+$

¹⁶ No J^{PC} determination.

¹⁷ No J^{PC} determination, width not determined.

¹⁸ $J^P = 2^+$.

¹⁹ From a fit to the 0^+ partial wave.

²⁰ No J^{PC} determination.

²¹ ALDE 92D combines all the GAMS-2000 data.

²² $J^P = 2^+$, superseded by FRENCH 99.

²³ From an analysis ignoring interference with $f_2'(1525)$.

²⁴ From an analysis including interference with $f_2'(1525)$.

²⁵ Superseded by ALDE 92D.

²⁶ Uses MRK3 data. From a partial-wave analysis of data using a K-matrix formalism with 5 poles, but assuming spin 2. Fit with constrained inelasticity.

²⁷ $J^P = 2^+$ preferred.

²⁸ From fit neglecting nearby $f_2'(1525)$. Replaced by BLOOM 83.

$f_0(1710)$

$$I^G(J^{PC}) = 0^+(0^{++})$$

See the review on "Non- $q\bar{q}$ Mesons."

- From partial wave analysis including all possible combinations of 0^{++} , 2^{++} , and 4^{++} resonances.
- Spin 0 favored over spin 2.
- In the SU(3) based model with a specific interference pattern of the $f_2(1270)$, $a_2^0(1320)$, and $f_2'(1525)$ mesons incoherently added to the $f_0(1710)$ and non-resonant background.
- Breit-Wigner width.
- $J^P = 0^+$, superseded by ARMSTRONG 89D.
- Systematic errors not estimated.
- This state may be different from $f_0(1710)$, see CLOSE 05.
- (Solution I)
- K-matrix pole, assuming $J^P = 0^+$, from combined analysis of $\pi^-\pi^0 \rightarrow \pi^0\pi^0 n$, $\pi^-\pi^0 \rightarrow K^+\bar{K}^0 n$, $\pi^+\pi^-\pi^0 \rightarrow \pi^+\pi^-\pi^0$, $\bar{p}p \rightarrow \pi^0\pi^0\pi^0$, $\pi^0\eta\eta$, $\pi^0\pi^0\eta$, $\pi^+\pi^-\pi^0$, $K^+K^-\pi^0$, $K_S^0 K_S^0 \pi^0$, $K^+K_S^0 \pi^-$ at rest, $\bar{p}p \rightarrow \pi^-\pi^-\pi^+$, $K_S^0 K^-\pi^0$, $K_S^0 K_S^0 \pi^-$ at rest.
- (Solution I)
- Decaying to $f_0(1370)\pi\pi$.
- T-matrix pole.
- $J^P = 0^+$.
- Not seen by AMSLER 02.
- Supersedes BARBERIS 99 and BARBERIS 99B.
- T-matrix pole, assuming $J^P = 0^+$
- No J^{PC} determination.
- No J^{PC} determination.
- From a fit to the 0^+ partial wave.
- No J^{PC} determination.
- ALDE 92d combines all the GAMS-2000 data.
- $J^P = 2^+$, (0^+ excluded).
- From an analysis ignoring interference with $f_2'(1525)$.
- From an analysis including interference with $f_2'(1525)$.
- Uses MRK3 data. From a partial-wave analysis of data using a K-matrix formalism with 5 poles, but assuming spin 2. Fit with constrained inelasticity.
- No J^{PC} determination.
- $J^P = 2^+$ preferred.
- From fit neglecting nearby $f_2'(1525)$. Replaced by BLOOM 83.
- From an amplitude analysis of the $K_S^0 K_S^0$ system, superseded by LONGACRE 86.

 $\eta(1760)$

$$I^G(J^{PC}) = 0^+(0^{-+})$$

OMITTED FROM SUMMARY TABLE

Seen by DM2 in the $\rho\rho$ system (BISELLO 89B). Structure in this region has been reported before in the same system (BALTRUSAITIS 86B) and in the $\omega\omega$ system (BALTRUSAITIS 85C, BISELLO 87).

1831 \pm 7		8,9 ABLIKIM	05R BES2	$J/\psi \rightarrow \gamma p\bar{p}$
1859 $^{+3}_{-10} \pm$ 5 $^{+5}_{-25}$		8 BAI	03F BES2	$J/\psi \rightarrow \gamma p\bar{p}$

- From a fit of the measured $\pi^+\pi^-\eta'$ lineshape that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold through interference with a second previously unseen narrow resonance near 1870 MeV. The fit uses Breit-Wigner functions for the signal shapes and includes known backgrounds and contributors.
- From a fit to $\gamma\phi$ invariant mass. Angular analysis consistent with $J^{PC} = 0^{-+}$. Other J^{PC} not excluded.
- Pole mass from a fit of the measured $\pi^+\pi^-\eta'$ lineshape to a Flatte formula that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold; the fit also includes known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner function ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit.
- From the fit including final state interaction effects in isospin 0 S-wave according to SIBIRTSSEV 05A. Supersedes ABLIKIM 10G.
- From a fit of the $\pi^+\pi^-\eta'$ mass distribution to a combination of $\gamma f_1(1510)$, $\gamma X(1835)$, and two unconfirmed states $\gamma X(2120)$, and $\gamma X(2370)$, for $M(p\bar{p}) < 2.8$ GeV, and accounting for backgrounds from non- η' events and $J/\psi \rightarrow \pi^0\pi^+\pi^-\eta'$.
- The selected process is $J/\psi \rightarrow \omega a_0(980)\pi$. This state may be due also to $\eta_2(1870)$ or to a combination of $X(1835)$ and $\eta_2(1870)$.
- From a fit of the $p\bar{p}$ mass distribution to a combination of $\gamma X(1835)$, γR with $M(R) = 2100$ MeV and $\Gamma(R) = 160$ MeV, and $\gamma p\bar{p}$ phase space, for $M(p\bar{p}) < 2.85$ GeV.
- Evidence for a threshold enhancement in the $p\bar{p}$ mass spectrum was also reported by ABE 02k, AUBERT,B 05L, and WANG 05A in $B^+ \rightarrow p\bar{p}K^+$, WANG 05A in $B^0 \rightarrow p\bar{p}K_S^0$, ABE 02w in $\bar{B}^0 \rightarrow p\bar{p}D^0$, DEL-AMO-SANCHEZ 12 in $B \rightarrow D(D^*)p\bar{p}(\pi)$, and WEI 08 in $B^+ \rightarrow p\bar{p}\pi^+$ decays. Not seen by ATHAR 06 in $\Upsilon(1S) \rightarrow p\bar{p}\gamma$.
- From the fit including final state interaction effects in isospin 0 S-wave according to SIBIRTSSEV 05A. Systematic errors not estimated.

¹ From a fit of the measured $\pi^+\pi^-\eta'$ lineshape that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold through interference with a second previously unseen narrow resonance near 1870 MeV. The fit uses Breit-Wigner functions for the signal shapes and includes known backgrounds and contributors.

² From a fit to $\gamma\phi$ invariant mass. Angular analysis consistent with $J^{PC} = 0^{-+}$. Other J^{PC} not excluded.

³ Pole width from a fit of the measured $\pi^+\pi^-\eta'$ lineshape to a Flatté formula that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold; the fit also includes known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner function ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit.

⁴ From the fit including final state interaction effects in isospin 0 S -wave according to SIBIRTSEV 05A. Supersedes ABLIKIM 10G.

⁵ From a fit of the $\pi^+\pi^-\eta'$ mass distribution to a combination of $\gamma f_1(1510), \gamma X(1835)$, and two unconfirmed states $\gamma X(2120)$, and $\gamma X(2370)$, for $M(p\bar{p}) < 2.8$ GeV, and accounting for backgrounds from non- η' events and $J/\psi \rightarrow \pi^0\pi^+\pi^-\eta'$.

⁶ The selected process is $J/\psi \rightarrow \omega\pi_0(980)\pi$. This state may be due also to $\eta_2(1870)$ or to a combination of $X(1835)$ and $\eta_2(1870)$.

⁷ From a fit of the $p\bar{p}$ mass distribution to a combination of $\gamma X(1835), \gamma R$ with $M(R) = 2100$ MeV and $\Gamma(R) = 160$ MeV, and $\gamma p\bar{p}$ phase space, for $M(p\bar{p}) < 2.85$ GeV.

⁸ Evidence for a threshold enhancement in the $p\bar{p}$ mass spectrum was also reported by ABE 02K, AUBERT,B 05L, and WANG 05A in $B^+ \rightarrow p\bar{p}K^+$, WANG 05A in $B^0 \rightarrow p\bar{p}K_S^0$, ABE 02W in $\bar{B}^0 \rightarrow p\bar{p}D^0$, DEL-AMO-SANCHEZ 12 in $B \rightarrow D(D^*)p\bar{p}(\pi)$, and WEI 08 in $B^+ \rightarrow p\bar{p}\pi^+$ decays. Not seen by ATHAR 06 in $\Upsilon(1S) \rightarrow p\bar{p}\gamma$.

⁹ From the fit including final state interaction effects in isospin 0 S -wave according to SIBIRTSEV 05A. Systematic errors not estimated.

seen	¹ ABLIKIM	16j	BES3	$J/\psi \rightarrow \gamma\pi^+\pi^-\eta'$
------	----------------------	-----	------	--

¹ ABLIKIM 16j quotes $B(J/\psi \rightarrow \gamma X(1835)) \times B(X(1835) \rightarrow \pi^+\pi^-\eta') = (3.93 \pm 0.38 \pm 0.31) \times 10^{-4}$ from a fit of the measured $\pi^+\pi^-\eta'$ lineshape that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold with a Flatté formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16j is that a second resonance near 1870 MeV interferes with the $X(1835)$; fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.

- 1 From the first PWA solution.
- 2 From a partial-wave analysis of the data.
- 3 From an amplitude analysis of the reaction $\pi^+ \pi^- \rightarrow 2 \pi^0$.
- 4 K matrix pole.
- 5 Taking into account the $f_2(1950)$. Helicity-2 production favored.
- 6 Energy-dependent analysis.
- 7 Single energy analysis.
- 8 From solution A of amplitude analysis of data on $\bar{p} p \rightarrow \pi \pi$. See however KLOET 96 who fit $\pi^+ \pi^-$ only and find waves only up to $J = 3$ to be important but not significantly resonant.
- 9 From solution B of amplitude analysis of data on $\bar{p} p \rightarrow \pi \pi$. See however KLOET 96 who fit $\pi^+ \pi^-$ only and find waves only up to $J = 3$ to be important but not significantly resonant.
- 10 $I(J^{PC}) = 0(4^+)$ from amplitude analysis assuming one-pion exchange.
- 11 Width errors enlarged by us to $4\Gamma/\sqrt{N}$; see the note with the $K^*(892)$ mass.

~2150	⁷ MARTIN	80C RVUE	
~2150	⁸ DULUDE	78B OSPK	1-2 $\bar{p}p \rightarrow \pi^0\pi^0$
⁵ OAKDEN 94 makes an amplitude analysis of LEAR data on $\bar{p}p \rightarrow \pi\pi$ using a method based on Barrelet zeros. This is solution A. The amplitude analysis of HASAN 94 includes earlier data as well, and assume that the data can be parametrized in terms of towers of nearly degenerate resonances on the leading Regge trajectory. See also KLOET 96 and MARTIN 97 who make related analyses.			
⁶ From solution B of amplitude analysis of data on $\bar{p}p \rightarrow \pi\pi$.			

⁷ $I(J^P) = 0(2^+)$ from simultaneous analysis of $p\bar{p} \rightarrow \pi^-\pi^+$ and $\pi^0\pi^0$.
⁸ $I(J^P) = 0(2^+)$ from partial-wave amplitude analysis.

••• We do not use the following data for averages, fits, limits, etc. •••

- From the fit to the BABAR data of LEES 13Q assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution. The resonance significance is 3.5 σ .
- From the fit to the BABAR data of LEES 13Q and BESIII data of ABLIKIM 19L assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution.
- Could also be another state. Seen in J/ψ decay with branching ratio $J/\psi \rightarrow X\pi^0 \rightarrow K^+ K^- \pi^0 = (6.7 \pm 1.1 \pm 2.2 \pm 1.8) \times 10^{-6}$.
- The observed structure can be due to both the $\phi(2170)$ and $\rho(2150)$.
- Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the $\rho(1450)$, $\rho(1700)$, and $\rho(2150)$ resonances as free parameters of the fit.
- Includes ATKINSON 85.

CHARGED KAON MASS

Revised 1994 by T.G. Trippe (LBNL).

The average of the six charged kaon mass measurements which we use in the Particle Listings is

$$m_{K^\pm} = 493.677 \pm 0.013 \text{ MeV } (S = 2.4), \quad (1)$$

where the error has been increased by the scale factor S . The large scale factor indicates a serious disagreement between different input data. The average before scaling the error is

$$m_{K^\pm} = 493.677 \pm 0.005 \text{ MeV }, \quad (2)$$

$$\chi^2 = 22.9 \text{ for } 5 \text{ D.F.}, \text{ Prob. } = 0.04\%,$$

where the high χ^2 and correspondingly low χ^2 probability further quantify the disagreement.

The main disagreement is between the two most recent and precise results,

$$m_{K^\pm} = 493.696 \pm 0.007 \text{ MeV} \quad \text{DENISOV 91}$$

$$m_{K^\pm} = 493.636 \pm 0.011 \text{ MeV } (S = 1.5) \quad \text{GALL 88}$$

$$\text{Average} = 493.679 \pm 0.006 \text{ MeV}$$

$$\chi^2 = 21.2 \text{ for } 1 \text{ D.F.}, \text{ Prob. } = 0.0004\%, \quad (3)$$

both of which are measurements of x-ray energies from kaonic atoms. Comparing the average in Eq. (3) with the overall average in Eq. (2), it is clear that DENISOV 91 and GALL 88 dominate the overall average, and that their disagreement is responsible for most of the high χ^2 .

The GALL 88 measurement was made using four different kaonic atom transitions, $K^- \text{Pb } (9 \rightarrow 8)$, $K^- \text{Pb } (11 \rightarrow 10)$, $K^- \text{W } (9 \rightarrow 8)$, and $K^- \text{W } (11 \rightarrow 10)$. The m_{K^\pm} values they obtain from each of these transitions is shown in the Particle Listings and in Fig. 1. Their $K^- \text{Pb } (9 \rightarrow 8)$ m_{K^\pm} is below and somewhat inconsistent with their other three transitions. The average of their four measurements is

$$m_{K^\pm} = 493.636 \pm 0.007,$$

$$\chi^2 = 7.0 \text{ for } 3 \text{ D.F.}, \text{ Prob. } = 7.2\%. \quad (4)$$

This is a low but acceptable χ^2 probability so, to be conservative, GALL 88 scaled up the error on their average by $S=1.5$ to obtain their published error ± 0.011 shown in Eq. (3) above and used in the Particle Listings average.

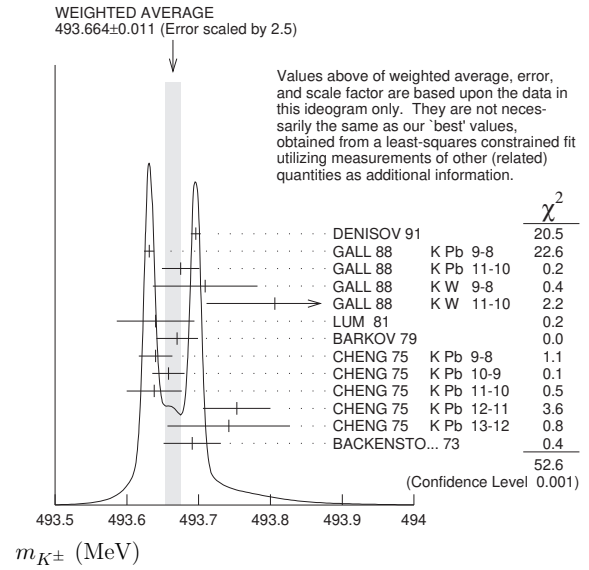

Figure 1: Ideogram of m_{K^\pm} mass measurements. GALL 88 and CHENG 75 measurements are shown separately for each transition they measured.

The ideogram in Fig. 1 shows that the DENISOV 91 measurement and the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ measurement yield two well-separated peaks. One might suspect the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ measurement since it is responsible both for the internal inconsistency in the GALL 88 measurements and the disagreement with DENISOV 91.

To see if the disagreement could result from a systematic problem with the $K^- \text{Pb } (9 \rightarrow 8)$ transition, we have separated the CHENG 75 data, which also used $K^- \text{Pb}$, into its separate transitions. Figure 1 shows that the CHENG 75 and GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ values are consistent, suggesting the possibility of a common effect such as contaminant nuclear γ rays near the $K^- \text{Pb } (9 \rightarrow 8)$ transition energy, although the CHENG 75 errors are too large to make a strong conclusion. The average of all 13 measurements has a χ^2 of 52.6 as shown in Fig. 1 and the first line of Table 1, yielding an unacceptable χ^2 probability of 0.00005%. The second line of Table 1 excludes both the GALL 88 and CHENG 75 measurements of the $K^- \text{Pb } (9 \rightarrow 8)$ transition and yields a χ^2 probability of 43%. The third [fourth] line of Table 1 excludes only the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ [DENISOV 91] measurement and yields a χ^2 probability of 20% [8.6%]. Table 1 shows that removing both measurements of the $K^- \text{Pb } (9 \rightarrow 8)$ transition produces the most consistent set of data, but that excluding only the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ transition or DENISOV 91 also produces acceptable probabilities.

Meson Particle Listings

 K^\pm **Table 1:** m_{K^\pm} averages for some combinations of Fig. 1 data.

m_{K^\pm} (MeV)	χ^2	D.F.	Prob. (%)	Measurements used
493.664 ± 0.004	52.6	12	0.00005	all 13 measurements
493.690 ± 0.006	10.1	10	43	no K^- Pb(9→8)
493.687 ± 0.006	14.6	11	20	no GALL 88 K^- Pb(9→8)
493.642 ± 0.006	17.8	11	8.6	no DENISOV 91

Yu.M. Ivanov, representing DENISOV 91, has estimated corrections needed for the older experiments because of improved ^{192}Ir and ^{198}Au calibration γ -ray energies. He estimates that CHENG 75 and BACKENSTOSS 73 m_{K^\pm} values could be raised by about 15 keV and 22 keV, respectively. With these estimated corrections, Table 1 becomes Table 2. The last line of Table 2 shows that if such corrections are assumed, then GALL 88 K^- Pb (9 → 8) is inconsistent with the rest of the data even when DENISOV 91 is excluded. Yu.M. Ivanov warns that these are rough estimates. Accordingly, we do not use Table 2 to reject the GALL 88 K^- Pb (9 → 8) transition, but we note that a future reanalysis of the CHENG 75 data could be useful because it might provide supporting evidence for such a rejection.

Table 2: m_{K^\pm} averages for some combinations of Fig. 1 data after raising CHENG 75 and BACKENSTOSS 73 values by 0.015 and 0.022 MeV respectively.

m_{K^\pm} (MeV)	χ^2	D.F.	Prob. (%)	Measurements used
493.666 ± 0.004	53.9	12	0.00003	all 13 measurements
493.693 ± 0.006	9.0	10	53	no K^- Pb(9→8)
493.690 ± 0.006	11.5	11	40	no GALL 88 K^- Pb(9→8)
493.645 ± 0.006	23.0	11	1.8	no DENISOV 91

The GALL 88 measurement uses a Ge semiconductor spectrometer which has a resolution of about 1 keV, so they run the risk of some contaminant nuclear γ rays. Studies of γ rays following stopped π^- and Σ^- absorption in nuclei (unpublished) do not show any evidence for contaminants according to GALL 88 spokesperson, B.L. Roberts. The DENISOV 91 measurement uses a crystal diffraction spectrometer with a resolution of 6.3 eV for radiation at 22.1 keV to measure the 4f-3d transition in K^- ^{12}C . The high resolution and the light nucleus reduce the probability for overlap by contaminant γ rays, compared with the measurement of GALL 88. The DENISOV 91 measurement is supported by their high-precision measurement of the 4d-2p transition energy in π^- ^{12}C , which is good agreement with the calculated energy.

While we suspect that the GALL 88 K^- Pb (9 → 8) measurements could be the problem, we are unable to find clear grounds for rejecting it. Therefore, we retain their measurement in the average and accept the large scale factor until further information can be obtained from new measurements and/or from reanalysis of GALL 88 and CHENG 75 data.

We thank B.L. Roberts (Boston Univ.) and Yu.M. Ivanov (Petersburg Nuclear Physics Inst.) for their extensive help in understanding this problem.

¹ Error increased from 0.0059 based on the error analysis in IVANOV 92.

² This value is the authors' combination of all of the separate transitions listed for this paper.

³ The CHENG 75 values for separate transitions were calculated from their Table 7 transition energies. The first error includes a 20% systematic error in the noncircular contaminant shift. The second error is due to a ± 5 eV uncertainty in the theoretical transition energies.

CONSTRAINED FIT INFORMATION

An overall fit to the mean life, a decay rate, and 15 branching ratios uses 35 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 53.4$ for 28 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

¹BATLEY 12 uses data collected in 2003-2004. The result is inclusive of $K^\pm \rightarrow \pi^+ \pi^- e^\pm \nu_\gamma$ decays. Using PDG 12 value for $\Gamma(\pi^+ \pi^- \pi^+)/\Gamma = (5.59 \pm 0.04) \times 10^{-2}$. BATLEY 12 obtains $B(\pi^+ \pi^- e \nu) = (4.257 \pm 0.004 \pm 0.035) \times 10^{-5}$ where the syst. error is dominated by the error on the normalization mode.

²PISLAK 01 reports $\Gamma(\pi^+ \pi^- e^+ \nu_e)/\Gamma_{\text{total}} = (4.109 \pm 0.008 \pm 0.110) \times 10^{-5}$ using the PDG 00 value $\Gamma(\pi^+ \pi^+ \pi^-)/\Gamma_{\text{total}} = (5.59 \pm 0.05) \times 10^{-2}$. We divide by the PDG value and unfold its error from the systematic error. PISLAK 03 and PISLAK 10A give additional details on the branching ratio measurement and give improved errors on the S-wave $\pi\pi$ scattering length: $a_0^0 = 0.235 \pm 0.013$ and $a_0^2 = -0.0410 \pm 0.0027$.

Hadronic modes with photons

$\Gamma(\pi^+ \pi^0 \gamma(INT))/\Gamma_{total}$		Γ_{21}/Γ	
--	--	----------------------	--

The $K^+ \rightarrow \pi^+ \pi^0 \gamma$ differential decay rate can be described in terms of T_{π^+} , the charged pion kinetic energy, and $W^2 = (P_K \cdot P_\gamma)(P_{\pi^+} \cdot P_\gamma) / (m_K m_{\pi^+})^2$; then we can write $d^2\Gamma(K^+ \rightarrow \pi^+ \pi^0 \gamma) / (dT_{\pi^+} dW^2) = d^2\Gamma(K^+ \rightarrow \pi^+ \pi^0 \gamma)_{IB} / (dT_{\pi^+} dW^2) [1 + 2 \cos(\pm\phi + \delta_1^+ - \delta_0^0) \frac{m_\pi^2 m_K^2 W^2 X_E + m_\pi^4 m_K^4 (X_E^2 + X_M^2) W^4]}{m_\pi^2 m_K^2 W^2 X_E + m_\pi^4 m_K^4 (X_E^2 + X_M^2) W^4}]$. The IB differential and total branching ratios are expressed in terms of the non-radiative experimental width $\Gamma(K^+ \rightarrow \pi^+ \pi^0)$ by Low's theorem. Using PDG 10 $B(K^+ \rightarrow \pi^+ \pi^0) = 0.2066 \pm 0.0008$, one obtains respectively $B(K^+ \rightarrow \pi^+ \pi^0 \gamma)_{IB} (55 < T_{\pi^+} < 90 \text{ MeV}) = 2.55 \times 10^{-4}$ and $B(K^+ \rightarrow \pi^+ \pi^0 \gamma)_{IB} (0 < T_{\pi^+} < 80 \text{ MeV}) = 1.80 \times 10^{-4}$. Fitting respectively the piece proportional to W^2 and the piece proportional to W^4 , the interference contribution (INT), proportional to X_E , and the direct contribution (DE) proportional to $X_E^2 + X_M^2$ are extracted.

$< 100 \pm 600$	90	CHEN	68 OSPK	+	$T_\pi 60\text{--}90 \text{ MeV}$	

¹ LAZZERONI 14 combines NA62 and NA48/2 results. The result for the full kinematic range is extrapolated from the model-independent branching fraction $(9.65 \pm 0.61 \pm 0.14) \times 10^{-7}$ for $(m_{\gamma\gamma}/m_K)^2 > 0.2$. The measured ChPT parameter $\tilde{c} = 1.86 \pm 0.25$.

² KITCHING 97 is extrapolated from their model-independent branching fraction $(6.0 \pm 1.5 \pm 0.7) \times 10^{-7}$ for $100 \text{ MeV}/c < P_\pi < 180 \text{ MeV}/c$ using Chiral Perturbation Theory.

³ BATLEY 14 uses data collected in 2003 and 2004. Branching ratio is obtained by determining the parameter $\tilde{c} = 1.41 \pm 0.38 \pm 0.11$ and integrating the $O(p^6)$ chiral spectrum. A model independent value for the branching ratio is also obtained $(8.77 \pm 0.87 \pm 0.17) \times 10^{-7}$ for kinematic range $(m_{\gamma\gamma}/m_K)^2 > 0.2$.

⁴ ARTAMONOV 05 limit assumes ChPT with $\tilde{c} = 1.8$ with unitarity corrections. With $\tilde{c} = 1.6$ and no unitarity corrections they obtain $< 2.3 \times 10^{-8}$ at 90% CL. This partial branching ratio is predicted to be 6.10×10^{-9} and 0.49×10^{-9} for the cases with and without unitarity correction.

DALITZ PLOT PARAMETERS FOR $K \rightarrow 3\pi$ DECAYS

Revised 1999 by T.G. Trippe (LBNL).

The Dalitz plot distribution for $K^\pm \rightarrow \pi^\pm \pi^\pm \pi^\mp$, $K^\pm \rightarrow \pi^0 \pi^0 \pi^\pm$, and $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$ can be parameterized by a series expansion such as that introduced by Weinberg [1]. We use the form

$$\begin{aligned} |M|^2 \propto & 1 + g \frac{(s_3 - s_0)}{m_{\pi^+}^2} + h \left[\frac{s_3 - s_0}{m_{\pi^+}^2} \right]^2 \\ & + j \frac{(s_2 - s_1)}{m_{\pi^+}^2} + k \left[\frac{s_2 - s_1}{m_{\pi^+}^2} \right]^2 \\ & + f \frac{(s_2 - s_1)(s_3 - s_0)}{m_{\pi^+}^2} + \dots, \end{aligned} \quad (1)$$

where $m_{\pi^+}^2$ has been introduced to make the coefficients g , h , j , and k dimensionless, and

$$s_i = (P_K - P_i)^2 = (m_K - m_i)^2 - 2m_K T_i, \quad i = 1, 2, 3,$$

$$s_0 = \frac{1}{3} \sum_i s_i = \frac{1}{3} (m_K^2 + m_1^2 + m_2^2 + m_3^2).$$

Here the P_i are four-vectors, m_i and T_i are the mass and kinetic energy of the i^{th} pion, and the index 3 is used for the odd pion.

The coefficient g is a measure of the slope in the variable s_3 (or T_3) of the Dalitz plot, while h and k measure the quadratic dependence on s_3 and $(s_2 - s_1)$, respectively. The coefficient j is related to the asymmetry of the plot and must be zero if CP invariance holds. Note also that if CP is good, g , h , and k must be the same for $K^+ \rightarrow \pi^+ \pi^+ \pi^-$ as for $K^- \rightarrow \pi^- \pi^- \pi^+$.

Since different experiments use different forms for $|M|^2$, in order to compare the experiments we have converted to g , h , j , and k whatever coefficients have been measured. Where such conversions have been done, the measured coefficient a_y , a_t , a_u , or a_v is given in the comment at the right. For definitions of

Meson Particle Listings

 K^\pm

these coefficients, details of this conversion, and discussion of the data, see the April 1982 version of this note [2].

¹ BATLEY 07E includes data from BATLEY 06A. Uses quadratic parametrization and PDG 06 value $g = 0.626 \pm 0.007$ to obtain $g_+ - g_- = (2.2 \pm 2.1 \pm 0.7) \times 10^{-4}$. Neglects any possible charge asymmetries in higher order slope parameters h or k .

² Asymmetry obtained assuming that $g_+ + g_- = 2 \times 0.652$ (PDG 02) and that asymmetries in h and k are zero.

³ Linear and quadratic slopes from PDG 04 are used. Any possible charge asymmetries in higher order slope parameters h or k are neglected.

ALTERNATIVE PARAMETRIZATIONS OF $K^\pm \rightarrow \pi^\pm \pi^0 \pi^0$ DALITZ PLOT

The following functional form for the matrix element suggested by $\pi\pi$ rescattering in $K^+ \rightarrow \pi^+ \pi^+ \pi^0 \rightarrow \pi^+ \pi^0 \pi^0$ is used for this fit (CABIBBO 04A, CABIBBO 05): Matrix element = $M_0 + M_1$ where $M_0 = 1 + (1/2)g_0 u + (1/2)h' u^2 + (1/2)k_0 v^2$ with $u = (s_3 - s_0) / (m_{\pi^+})^2$, $v = (s_2 - s_1) / (m_{\pi^+})^2$ and where M_1 takes into account the non-analytic piece due to $\pi\pi$ rescattering amplitudes a_0 and a_2 ; The parameters g_0 and h' are related to the parameters g and h of the matrix element squared given in the previous section by the approximations $g_0 \sim g^{PDG}$ and $h' \sim h^{PDG} - (g/2)^2$ and $k_0 \sim k^{PDG}$.

In addition, we also consider the effective field theory framework of COLANGELO 06A and BISSEGER 09 to extract g_{BB} and h'_{BB} .

 $K_{\ell 3}^\pm$ AND $K_{\ell 3}^0$ FORM FACTORS

Updated September 2013 by T.G. Trippe (LBNL) and C.-J. Lin (LBNL).

Assuming that only the vector current contributes to $K \rightarrow \pi \ell \nu$ decays, we write the matrix element as

$$M \propto f_+(t) [(P_K + P_\pi)_\mu \bar{\ell} \gamma_\mu (1 + \gamma_5) \nu] + f_-(t) [m_\ell \bar{\ell} (1 + \gamma_5) \nu], \quad (1)$$

where P_K and P_π are the four-momenta of the K and π mesons, m_ℓ is the lepton mass, and f_+ and f_- are dimensionless form factors which can depend only on $t = (P_K - P_\pi)^2$, the square of the four-momentum transfer to the leptons. If time-reversal invariance holds, f_+ and f_- are relatively real. $K_{\mu 3}$ experiments, discussed immediately below, measure f_+ and f_- , while $K_{e 3}$ experiments, discussed further below, are sensitive only to f_+ because the small electron mass makes the f_- term negligible.

$K_{\mu 3}$ Experiments. Analyses of $K_{\mu 3}$ data frequently assume a linear dependence of f_+ and f_- on t , i.e.,

$$f_\pm(t) = f_\pm(0) [1 + \lambda_\pm(t/m_{\pi^+}^2)]. \quad (2)$$

Most $K_{\mu 3}$ data are adequately described by Eq. (2) for f_+ and a constant f_- (i.e., $\lambda_- = 0$).

Two commonly used equivalent parametrizations:

(1) λ_+ , $\xi(0)$ parametrization. Older analyses of $K_{\mu 3}$ data often introduce the ratio of the two form factors

$$\xi(t) = f_-(t)/f_+(t). \quad (3)$$

The $K_{\mu 3}$ decay distribution is then described by the two parameters λ_+ and $\xi(0)$ (assuming time reversal invariance and $\lambda_- = 0$).

(2) λ_+ , λ_0 parametrization. More recent $K_{\mu 3}$ analyses have parametrized in terms of the form factors f_+ and f_0 , which are associated with vector and scalar exchange, respectively, to the lepton pair. f_0 is related to f_+ and f_- by

$$f_0(t) = f_+(t) + [t/(m_K^2 - m_\pi^2)] f_-(t). \quad (4)$$

Here $f_0(0)$ must equal $f_+(0)$ unless $f_-(t)$ diverges at $t = 0$. The earlier assumption that f_+ is linear in t and f_- is constant leads to f_0 linear in t :

$$f_0(t) = f_0(0) [1 + \lambda_0(t/m_{\pi^+}^2)]. \quad (5)$$

With the assumption that $f_0(0) = f_+(0)$, the two parametrizations, $(\lambda_+, \xi(0))$ and (λ_+, λ_0) are equivalent as long as correlation information is retained. (λ_+, λ_0) correlations tend to be less strong than $(\lambda_+, \xi(0))$ correlations.

Since the 2006 edition of the *Review* [4], we no longer quote results in the $(\lambda_+, \xi(0))$ parametrization. We have removed many older low statistics results from the Listings. See the 2004 version of this note [5] for these older results, and the 1982 version [6] for additional discussion of the $K_{\mu 3}^0$ parameters, correlations, and conversion between parametrizations.

Quadratic Parametrization. More recent high-statistics experiments have included a quadratic term in the expansion of $f_+(t)$,

$$f_+(t) = f_+(0) \left[1 + \lambda'_+(t/m_{\pi^+}^2) + \frac{\lambda''_+}{2} (t/m_{\pi^+}^2)^2 \right]. \quad (6)$$

If there is a non-vanishing quadratic term, then λ_+ of Eq. (2) represents the average slope, which is then different from λ'_+ . Our convention is to include the factor $\frac{1}{2}$ in the quadratic term, and to use m_{π^+} even for $K_{e 3}^+$ and $K_{\mu 3}^+$ decays. We have converted other's parametrizations to match our conventions, as noted in the beginning of the " $K_{\ell 3}^\pm$ and $K_{\ell 3}^0$ Form Factors" sections of the Listings.

Pole Parametrization. The pole model describes the t -dependence of $f_+(t)$ and $f_0(t)$ in terms of the exchange of the lightest vector and scalar K^* mesons with masses M_v and M_s , respectively:

$$f_+(t) = f_+(0) \left[\frac{M_v^2}{M_v^2 - t} \right], \quad f_0(t) = f_0(0) \left[\frac{M_s^2}{M_s^2 - t} \right]. \quad (7)$$

Dispersive Parametrization. This approach [7,8] uses dispersive techniques and the known low-energy $K\pi$ phases to parametrize the vector and scalar form factors:

$$f_+(t) = f_+(0) \exp \left[\frac{t}{m_\pi^2} (\Lambda_+ + H(t)) \right]; \quad (8)$$

$$f_0(t) = f_+(0) \exp \left[\frac{t}{(m_K^2 - m_\pi^2)} (\ln[C] - G(t)) \right], \quad (9)$$

where Λ_+ is the slope of the vector form factor, and $\ln[C] = \ln[f_0(m_K^2 - m_\pi^2)]$ is the logarithm of the scalar form factor at

Meson Particle Listings

K^\pm

the Callan-Treiman point. The functions $H(t)$ and $G(t)$ are dispersive integrals.

K_{e3} Experiments. Analysis of K_{e3} data is simpler than that of $K_{\mu 3}$ because the second term of the matrix element assuming a pure vector current [Eq. (1) above] can be neglected. Here f_+ can be assumed to be linear in t , in which case the linear coefficient λ_+ of Eq. (2) is determined, or quadratic, in which case the linear coefficient λ'_+ and quadratic coefficient λ''_+ of Eq. (6) are determined.

If we remove the assumption of a pure vector current, then the matrix element for the decay, in addition to the terms in Eq. (1), would contain

$$+2m_K f_S \bar{\ell}(1 + \gamma_5)\nu + (2f_T/m_K)(P_K)_\lambda(P_\pi)_\mu \bar{\ell}\sigma_{\lambda\mu}(1 + \gamma_5)\nu, \quad (10)$$

where f_S is the scalar form factor, and f_T is the tensor form factor. In the case of the K_{e3} decays where the f_- term can be neglected, experiments have yielded limits on $|f_S/f_+|$ and $|f_T/f_+|$.

Fits for K_{e3} Form Factors. For K_{e3} data, we determine best values for the three parametrizations: linear (λ_+), quadratic (λ'_+ , λ''_+) and pole (M_V). For $K_{\mu 3}$ data, we determine best values for the three parametrizations: linear (λ_+ , λ_0), quadratic (λ'_+ , λ''_+ , λ_0) and pole (M_V , M_S). We then assume $\mu - e$ universality so that we can combine K_{e3} and $K_{\mu 3}$ data, and again determine best values for the three parametrizations: linear (λ_+ , λ_0), quadratic (λ'_+ , λ''_+ , λ_0), and pole (M_V , M_S). When there is more than one parameter, fits are done including input correlations. Simple averages suffice in the two K_{e3} cases where there is only one parameter: linear (λ_+) and pole (M_V).

Both KTeV and KLOE see an improvement in the quality of their fits relative to linear fits when a quadratic term is introduced, as well as when the pole parametrization is used. The quadratic parametrization has the disadvantage that the quadratic parameter λ''_+ is highly correlated with the linear parameter λ'_+ , in the neighborhood of 95%, and that neither parameter is very well determined. The pole fit has the same number of parameters as the linear fit, but yields slightly better fit probabilities, so that it would be advisable for all experiments to include the pole parametrization as one of their choices [9].

The “Kaon Particle Listings” show the results with and without assuming $\mu - e$ universality. The “Meson Summary Tables” show all of the results assuming $\mu - e$ universality, but most results not assuming $\mu - e$ universality are given only in the Listings.

K_{e3}^\pm FORM FACTORS

In the form factor comments, the following symbols are used.

f_+ and f_- are form factors for the vector matrix element.

f_S and f_T refer to the scalar and tensor term.

$f_0 = f_+ + f_- t/(m_{K^+}^2 - m_{\pi^0}^2)$.

$t =$ momentum transfer to the π .

λ_+ and λ_0 are the linear expansion coefficients of f_+ and f_0 :

$f_+(t) = f_+(0) (1 + \lambda_+ t/m_{\pi^+}^2)$

For quadratic expansion

$f_+(t) = f_+(0) (1 + \lambda'_+ t/m_{\pi^+}^2 + \frac{\lambda''_+}{2} t^2/m_{\pi^+}^4)$

as used by KTeV. If there is a non-vanishing quadratic term, then λ_+ represents an average slope, which is then different from λ'_+ .

NA48/2 and OKA quadratic expansion coefficients are converted with $\lambda'_+{}^{PDG} = \lambda'_+{}^{NA48/2}$ and $\lambda''_+{}^{PDG} = 2 \lambda''_+{}^{NA48/2}$

$\lambda'_+{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda'_+{}^{OKA}$ and

$\lambda''_+{}^{PDG} = 2 (\frac{m_{\pi^+}}{m_{\pi^0}})^4 \lambda''_+{}^{OKA}$

OKA linear expansion coefficients are converted with $\lambda_+{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+{}^{OKA}$ and $\lambda_0{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_0{}^{OKA}$

The pole parametrization is

$f_+(t) = f_+(0) (\frac{M_V^2}{M_V^2 - t})$

$f_0(t) = f_0(0) (\frac{M_S^2}{M_S^2 - t})$

where M_V and M_S are the vector and scalar pole masses.

The following abbreviations are used:

DP = Dalitz plot analysis.

PI = π spectrum analysis.

MU = μ spectrum analysis.

POL = μ polarization analysis.

BR = $K_{\mu 3}^\pm/K_{e3}^\pm$ branching ratio analysis.

E = positron or electron spectrum analysis.

RC = radiative corrections.

For previous λ'_+ and λ''_+ parametrizations used by NA48 (e.g. LAI 07A) and ISTRA (e.g. YUSHCHENKO 04B) see PDG 18.

λ_+ (LINEAR ENERGY DEPENDENCE OF f_+ IN K_{e3}^\pm DECAY)

These results are for a linear expansion only. See the next section for fits including a quadratic term. $-51.3 \pm 3.3 \pm 3.5$	400k	³ PISLAK	03	B865	\pm

¹ Radiative corrections included. Using Roy equations and including isospin breaking, BATLEY 10c obtains the following scattering lengths $a_0^0 = 0.2220 \pm 0.0128 \pm 0.0050 \pm 0.0037$ (theor.), $a_0^2 = -0.0432 \pm 0.0086 \pm 0.0034 \pm 0.0028$ (theor.). Supersedes BATLEY 08A.

² Radiative corrections included. Using Roy equations and not including isospin breaking, BATLEY 08A obtains the following $\pi\pi$ scattering length $a_0^0 = 0.233 \pm 0.016 \pm 0.007$, $a_0^2 = -0.0471 \pm 0.011 \pm 0.004$.

³ Radiative corrections included. Using Roy equations PISLAK 03 obtains the following scattering lengths $a_0^0 = 0.203 \pm 0.033 \pm 0.004$, $a_0^2 = -0.055 \pm 0.023 \pm 0.003$.

DECAY FORM FACTOR FOR $K^\pm \rightarrow \pi^0 \pi^0 e^\pm \nu$

Given in BOLOTOV 86b, BARMIN 88b, and SHIMIZU 04.

$K^\pm \rightarrow \ell^\pm \nu \gamma$ FORM FACTORS

For definitions of the axial-vector F_A and vector F_V form factor, see the "Note on $\pi^\pm \rightarrow \ell^\pm \nu \gamma$ and $K^\pm \rightarrow \ell^\pm \nu \gamma$ Form Factors" in the π^\pm section. In the kaon literature, often different definitions $a_K = F_A/m_K$ and $v_K = F_V/m_K$ are used.

$F_A + F_V$, SUM OF AXIAL-VECTOR AND VECTOR FORM FACTOR FOR $K \rightarrow e\nu e\gamma$

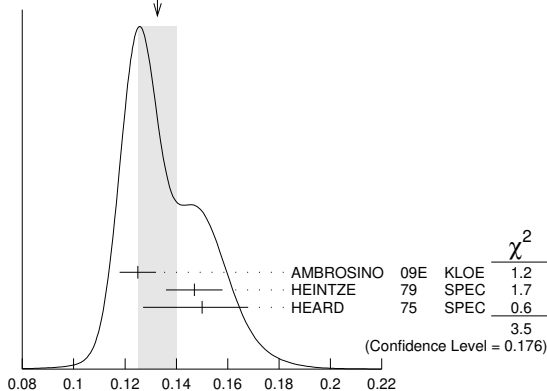

VALUE	EVTS	DOCUMENT ID	TECN	CHG	COMMENT
0.133 ± 0.008 OUR AVERAGE		Error includes scale factor of 1.3.			See the ideogram below.
$0.125 \pm 0.007 \pm 0.001$	1.4K	¹ AMBROSINO	09E	KLOE	E_γ in 10–250 MeV, $p_e > 200$ MeV/c
0.147 ± 0.011	51	² HEINTZE	79	SPEC	
0.150 ± 0.018 -0.023	56	³ HEARD	75	SPEC	

¹ AMBROSINO 09E measures the absolute value $|F_A + F_V|$ which is parametrized as $|F_A + F_V| = F_V (1 + \lambda(1-x)) + F_A$, $x = 2E_\gamma/m_K$. ($F_A + F_V$) and λ are fit parameters. The fitted value of $\lambda = 0.38 \pm 0.20 \pm 0.02$ with a correlation of -0.93 between ($F_A + F_V$) and λ .

² HEINTZE 79 quotes absolute value of $|F_A + F_V| \sin\theta_c$. We use $\sin\theta_c = V_{us} = 0.2205$.

³ HEARD 75 quotes absolute value of $|F_A + F_V| \sin\theta_c$. We use $\sin\theta_c = V_{us} = 0.2205$.

T-VIOLATION PARAMETER IN K⁰-K⁰ MIXING

The asymmetry $A_T = \frac{\Gamma(\bar{K}^0 \rightarrow K^0) - \Gamma(K^0 \rightarrow \bar{K}^0)}{\Gamma(\bar{K}^0 \rightarrow K^0) + \Gamma(K^0 \rightarrow \bar{K}^0)}$ must vanish if T invariance holds.

ASYMMETRY A_T IN K⁰-K⁰ MIXING

VALUE (units 10 ⁻³)	EVTS	DOCUMENT ID	TECN
6.6 ± 1.3 ± 1.0	640k	¹ ANGELOPOULOS... 98E	CPLR

¹ ANGELOPOULOS 98E measures the asymmetry $A_T = [\Gamma(\bar{K}^0_{t=0} \rightarrow e^+\pi^-\nu_{t=\tau}) - \Gamma(K^0_{t=0} \rightarrow e^-\pi^+\nu_{t=\tau})] / [\Gamma(\bar{K}^0_{t=0} \rightarrow e^+\pi^-\nu_{t=\tau}) + \Gamma(K^0_{t=0} \rightarrow e^-\pi^+\nu_{t=\tau})]$ as a function of the neutral-kaon eigentime τ . The initial strangeness of the neutral kaon is tagged by the charge of the accompanying charged kaon in the reactions $p\bar{p} \rightarrow K^-\pi^+K^0$ and $p\bar{p} \rightarrow K^+\pi^-K^0$. The strangeness at the time of the decay is tagged by the lepton charge. The reported result is the average value of A_T over the interval $1\tau_S < \tau < 20\tau_S$. From this value of A_T ANGELOPOULOS 01B, assuming CP T invariance in the $e\pi\nu$ decay amplitude, determine the T -violating as $\Delta S = \Delta S$ conserving parameter (for its definition, see Review below) $4\text{Re}(\epsilon) = (6.2 \pm 1.4 \pm 1.0) \times 10^{-3}$.

See the related review(s):

[CPT Invariance Tests in Neutral Kaon Decay](#)

CP-VIOLATION PARAMETERS

VALUE (units 10 ⁻³)	DOCUMENT ID	TECN
1.596 ± 0.013	¹ AMBROSINO 06H	KLOE
• • • We do not use the following data for averages, fits, limits, etc. • • •		
1.664 ± 0.010	² LAI 05A	NA48

¹ AMBROSINO 06H uses Bell-Steinberger relations with the following measurements: $B(K_L^0 \rightarrow \pi^+\pi^-)$ in AMBROSINO 06F, $B(K_S^0 \rightarrow \pi^0\pi^0\pi^0)$ in AMBROSINO 05B, the K_S^0 -semileptonic charge asymmetry in AMBROSINO 06E, and K^0 -semileptonic results in ANGELOPOULOS 98F.

² LAI 05A values are obtained through unitarity (Bell-Steinberger relations), improving determination of η_{000} and combining other data from PDG 04 and APOSTOLAKIS 99B.

CPT-VIOLATION PARAMETERS

In K^0 - \bar{K}^0 mixing, if CP -violating interactions include a T conserving part then

$$|K_S\rangle = [|K_1\rangle + (\epsilon + \delta)|K_2\rangle] / \sqrt{1 + |\epsilon + \delta|^2}$$

$$|K_L\rangle = [|K_2\rangle + (\epsilon - \delta)|K_1\rangle] / \sqrt{1 + |\epsilon - \delta|^2}$$

where

$$|K_1\rangle = [|K^0\rangle + |\bar{K}^0\rangle] / \sqrt{2}$$

$$|K_2\rangle = [|K^0\rangle - |\bar{K}^0\rangle] / \sqrt{2}$$

and

$$|\bar{K}^0\rangle = CP|K^0\rangle.$$

The parameter δ specifies the CP -violating part.

Estimates of δ are given below assuming the validity of the $\Delta S = \Delta Q$ rule. See also THOMSON 95 for a test of CP -symmetry conservation in K^0 decays using the Bell-Steinberger relation.

REAL PART OF δ

A nonzero value violates CP T invariance.

2100 ± 3700	6481	⁶ DEMIDOV 95		$K_{\ell 3}$ reanalysis

- ABOUZAID 11 uses Bell-Steinberger relations.
- AMBROSINO 06H uses Bell-Steinberger relations with the following measurements: $B(K_L^0 \rightarrow \pi^+\pi^-)$ in AMBROSINO 06F, $B(K_S^0 \rightarrow \pi^0\pi^0\pi^0)$ in AMBROSINO 05B, the K^0 -semileptonic charge asymmetry in AMBROSINO 06E, and K^0 -semileptonic results in ANGELOPOULOS 98F.
- LAI 05A values are obtained through unitarity (Bell-Steinberger relations), improving determination of η_{000} and combining other data from PDG 04 and APOSTOLAKIS 99B.
- APOSTOLAKIS 99B assumes only unitarity and combines CPLEAR and other results.
- If $\Delta S = \Delta Q$ is not assumed, ANGELOPOULOS 98F finds $\text{Im}\delta = (-15 \pm 23 \pm 3) \times 10^{-3}$.
- DEMIDOV 95 reanalyzes data from HART 73 and NIEBERGALL 74.

Re(y)

A non-zero value would violate CP T invariance in $\Delta S = \Delta Q$ amplitude. $\text{Re}(y)$ is the following combination of K_{e3} decay amplitudes:

$$\text{Re}(y) = \text{Re} \left(\frac{A(\bar{K}^0 \rightarrow e^-\pi^+\nu_e) - A(K^0 \rightarrow e^+\pi^-\nu_e)}{A(K^0 \rightarrow e^-\pi^+\nu_e) + A(\bar{K}^0 \rightarrow e^+\pi^-\nu_e)} \right)$$

VALUE (units 10 ⁻³)	EVTS	DOCUMENT ID	TECN

• • • We do not use the following data for averages, fits, limits, etc. • • •			
0.3 ± 3.1		² APOSTOLA... 99B	CPLR

- They use the PDG 04 for the K_L^0 semileptonic charge asymmetry and PDG 04 (CP review, CP NOT ASSUMED) for $\text{Re}(\epsilon)$.
- Constrained by Bell-Steinberger (or unitarity) relation.

Re(x₋)

A non-zero value would violate CP T invariance in decay amplitudes with $\Delta S \neq \Delta Q$. x_- , used here to define $\text{Re}(x_-)$, and x_+ , used below in the $\Delta S = \Delta Q$ section are the following combinations of K_{e3} decay amplitudes:

$$x_- = \frac{1}{2} \left(\frac{A(\bar{K}^0 \rightarrow \pi^-\pi^+\nu_e) + A(K^0 \rightarrow \pi^+\pi^-\nu_e)}{A(K^0 \rightarrow \pi^-\pi^+\nu_e)} \pm \frac{A(K^0 \rightarrow \pi^+\pi^-\nu_e)}{A(K^0 \rightarrow \pi^+\pi^-\nu_e)} \right)$$

K_S^0 MEAN LIFE

For earlier measurements, beginning with BOLDT 58B, see our 1986 edition, Physics Letters **170B** 130 (1986).

OUR FIT is described in the note on " CP violation in K_L decays" in the K^0 Particle Listings. The result labeled "OUR FIT Assuming CP^T " ["OUR FIT Not assuming CP^T "] includes all measurements except those with the comment "Not assuming CP^T " ["Assuming CP^T "]. Measurements with neither comment do not assume CPT and enter both fits.

- ¹ The two ABOUZAID 11 values use the same full KTeV dataset from 1996, 1997, and 1999. The first enters the "assuming CP^T " fit and the second enters the "not assuming CP^T " fit.
- ² ABOUZAID 11 fit has Δm , τ_S , ϕ_e , $\text{Re}(\epsilon'/\epsilon)$, and $\text{Im}(\epsilon'/\epsilon)$ as free parameters. See $\text{Im}(\epsilon'/\epsilon)$ in the " K_L^0 CP violation" section for correlation information.
- ³ ABOUZAID 11 fit has Δm and τ_S free but constrains ϕ_e to the Superweak value, i.e. assumes CP^T . This τ_S value is correlated with their $\Delta m = m_{K_L^0} - m_{K_S^0}$ measurement in the K_L^0 listings. The correlation coefficient $\rho(\tau_S, \Delta m) = -0.670$.
- ⁴ Fit to the proper time distribution.
- ⁵ This ALAVI-HARATI 03 fit has Δm and τ_S free but constrains ϕ_{+-} to the Superweak value, i.e. assumes CPT . This τ_S value is correlated with their $\Delta m = m_{K_L^0} - m_{K_S^0}$ measurement in the K_L^0 listings. The correlation coefficient $\rho(\tau_S, \Delta m) = -0.396$. Superseded by ABOUZAID 11.
- ⁶ This ALAVI-HARATI 03 fit has Δm , ϕ_{+-} , and τ_{K_S} free. See ϕ_{+-} in the " K_L CP violation" section for correlation information. Superseded by ABOUZAID 11.
- ⁷ ARONSON 82 find that K_S^0 mean life may depend on the kaon energy.
- ⁸ CARITHERS 75 measures the Δm dependence of the total decay rate (inverse mean life) to be $\Gamma(K_S^0) = [(1.122 \pm 0.004) + 0.16(\Delta m - 0.5348)/\Delta m] 10^{10}/s$, or, in terms of mean life, CARITHERS 75 measures $\tau_S = (0.8913 \pm 0.0032) - 0.238 [\Delta m - 0.5348] (10^{-10} \text{ s})$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- ⁹ HILL 68 has been changed by the authors from the published value (0.865 ± 0.009) because of a correction in the shift due to η_{+-} . SKJEGGESTAD 72 and HILL 68 give detailed discussions of systematics encountered in this type of experiment.
- ¹⁰ Pre-1971 experiments are excluded from the average because of disagreement with later more precise experiments.

[a] See the Particle Listings below for the energy limits used in this measurement.

[b] Most of this radiative mode, the low-momentum γ part, is also included in the parent mode listed without γ 's.

[c] The value is for the sum of the charge states or particle/antiparticle states indicated.

[d] Not a measurement. Calculated as $0.666 \cdot B(\pi^\pm e^\mp \nu_e)$.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 5 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 0.1$ for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

3.9 \pm 5.4	5 THOMSON 94 E621 Sup. by ZOU 96

1 BATLEY 05 is obtained by measuring the interference parameters in $K_S, K_L \rightarrow \pi^+ \pi^- \pi^0$. $\text{Re}(\lambda) = 0.038 \pm 0.008 \pm 0.006$ and $\text{Im}(\lambda) = -0.013 \pm 0.005 \pm 0.004$; the correlation coeff. between $\text{Re}(\lambda)$ and $\text{Im}(\lambda)$ is 0.66 (statistical only).

2 ADLER 97b find the CP-conserving parameters $\text{Re}(\lambda) = (28 \pm 7 \pm 3) \times 10^{-3}$, $\text{Im}(\lambda) = (-10 \pm 8 \pm 2) \times 10^{-3}$. They estimate $B(K_S^0 \rightarrow \pi^+ \pi^- \pi^0)$ from $\text{Re}(\lambda)$ and the K_L^0 decay parameters. See also ANGELOPOULOS 98c.

3 ZOU 96 is from the the measured quantities $|\rho_{+-0}| = 0.039 \pm_{-0.006}^{+0.009} \pm 0.005$ and $\phi_\rho = (-9 \pm 18)^\circ$.

4 ADLER 96e is from the measured quantities $\text{Re}(\lambda) = 0.036 \pm 0.010 \pm_{-0.005}^{+0.002}$ and $\text{Im}(\lambda)$ consistent with zero. Note that the quantity λ is the same as ρ_{+-0} used in other footnotes.

5 THOMSON 94 calculates this branching ratio from their measurements $|\rho_{+-0}| = 0.035 \pm_{-0.011}^{+0.019} \pm 0.004$ and $\phi_\rho = (-59 \pm 48)^\circ$ where $|\rho_{+-0}| e^{i\phi_\rho} = A(K_S^0 \rightarrow \pi^+ \pi^- \pi^0, l = 2) / A(K_L^0 \rightarrow \pi^+ \pi^- \pi^0)$.

-----------	----	--	------------	---------	---

¹ Reconstructed from $K^0(\overline{K}^0)(t) \rightarrow \pi e \nu$ distributions using PDG values of $B(K_L^0 \rightarrow \pi e \nu) = 0.4053 \pm 0.0015$, $\tau_L = (5.114 \pm 0.021) \times 10^{-8}$ s and $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$ s.

² Uses the PDG 00 value for $B(K_S^0 \rightarrow \pi^+\pi^-)$.

³ Obtained by imposing $\sum_i B(K_S^0 \rightarrow i) = 1$, where i runs over all the four branching ratios $\pi^+\pi^-$, $\pi^0\pi^0$, $\pi e \nu$, and $\pi \mu \nu$. Input value of $B(K_S^0 \rightarrow \pi^+\pi^-) / B(K_S^0 \rightarrow \pi^0\pi^0)$ from AMBROSINO 06c is used. To derive $\Gamma(K_S^0 \rightarrow \pi^+\pi^-) / \Gamma(K_S^0 \rightarrow \pi^+\pi^-)$, lepton universality is assumed, radiative corrections from ANDRE 07 are used, and phase space integrals are taken from KTeV, ALEXOPOULOS 04A. This branching fraction enters our fit via their $\Gamma(\pi^\pm e^\mp \nu_e) / \Gamma(\pi^+\pi^-)$ branching ratio measurement.

 $\Gamma(\pi^\pm \mu^\mp \nu_\mu)/\Gamma_{\text{total}}$ Γ_9/Γ

The PDG 06 value below has not been measured but is computed to be 0.666 times the $K_S \rightarrow \pi^\pm e^\mp \nu_e$ branching fraction. It is included in the fit that constrains the four branching ratios $\pi^+\pi^-$, $\pi^0\pi^0$, $\pi e \nu$, and $\pi \mu \nu$ to sum to 1. This treatment, used by AMBROSINO 06E, is preferable to our previous practice of constraining the $\pi^+\pi^-$ and $\pi^0\pi^0$ modes to sum to 1. The 0.666 factor is obtained from AMBROSINO 06E and assumes lepton universality, radiative corrections from ANDRE 07, and phase space integrals from KTeV, ALEXOPOULOS 04A.

 K_S^0 FORM FACTORS

For discussion, see note on $K_{\ell 3}$ form factors in the K^\pm section of the Particle Listings above. Because the semileptonic branching fraction is smaller in K_S^0 than K_L^0 by the ratio of the mean lives, the K_S^0 semileptonic form factor has so far been measured only in the K_{e3} mode using the linear expansion $f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$, which gives the vector form factor $f_+(t)$ relative to its value at $t = 0$.

CP VIOLATION IN $K_S \rightarrow 3\pi$

Written 1996 by T. Nakada (Paul Scherrer Institute) and L. Wolfenstein (Carnegie-Mellon University).

The possible final states for the decay $K^0 \rightarrow \pi^+\pi^-\pi^0$ have isospin $I = 0, 1, 2$, and 3 . The $I = 0$ and $I = 2$ states have $CP = +1$ and K_S can decay into them without violating CP symmetry, but they are expected to be strongly suppressed by centrifugal barrier effects. The $I = 1$ and $I = 3$ states, which have no centrifugal barrier, have $CP = -1$ so that the K_S decay to these requires CP violation.

In order to see CP violation in $K_S \rightarrow \pi^+\pi^-\pi^0$, it is necessary to observe the interference between K_S and K_L decay, which determines the amplitude ratio

$$\eta_{+-0} = \frac{A(K_S \rightarrow \pi^+\pi^-\pi^0)}{A(K_L \rightarrow \pi^+\pi^-\pi^0)} \quad (1)$$

If η_{+-0} is obtained from an integration over the whole Dalitz plot, there is no contribution from the $I = 0$ and $I = 2$ final states and a nonzero value of η_{+-0} is entirely due to CP violation.

Only $I = 1$ and $I = 3$ states, which are $CP = -1$, are allowed for $K^0 \rightarrow \pi^0\pi^0\pi^0$ decays and the decay of K_S into $3\pi^0$ is an unambiguous sign of CP violation. Similarly to η_{+-0} , η_{000} is defined as

$$\eta_{000} = \frac{A(K_S \rightarrow \pi^0\pi^0\pi^0)}{A(K_L \rightarrow \pi^0\pi^0\pi^0)} \quad (2)$$

If one assumes that CPT invariance holds and that there are no transitions to $I = 3$ (or to nonsymmetric $I = 1$ states), it can be shown that

$$\begin{aligned} \eta_{+-0} &= \eta_{000} \\ &= \epsilon + i \frac{\text{Im } a_1}{\text{Re } a_1} \end{aligned} \quad (3)$$

With the Wu-Yang phase convention, a_1 is the weak decay amplitude for K^0 into $I = 1$ final states; ϵ is determined from CP violation in $K_L \rightarrow 2\pi$ decays. The real parts of η_{+-0} and η_{000} are equal to $\text{Re}(\epsilon)$. Since currently-known upper limits on $|\eta_{+-0}|$ and $|\eta_{000}|$ are much larger than $|\epsilon|$, they can be interpreted as upper limits on $\text{Im}(\eta_{+-0})$ and $\text{Im}(\eta_{000})$ and so as limits on the CP -violating phase of the decay amplitude a_1 .

CP-VIOLATION PARAMETERS IN K_S^0 DECAY

$$A_S = [\Gamma(K_S^0 \rightarrow \pi^- e^+ \nu_e) - \Gamma(K_S^0 \rightarrow \pi^+ e^- \bar{\nu}_e)] / \text{SUM}$$

Such asymmetry violates CP . If CPT is assumed then $A_S = 2 \text{Re}(\epsilon)$.

0.000 ± 0.009 ± 0.013		4.9M	¹ LAI	05A NA48	Assumes CPT
-0.05 ± 0.12 ± 0.05		17300	² ANGELOPOULOS 98B	CPLR	Assumes CPT
¹ LAI 05A assumes $\text{Re}(\eta_{000}) = \text{Re}(\epsilon) = 1.66 \times 10^{-3}$. The equivalent limit is $ \eta_{000} _{CPT} < 0.025$ at 90% CL. Without assuming CPT invariance, they obtain $\text{Re}(\eta_{000}) = -0.002 \pm 0.011 \pm 0.015$ and $\text{Im}(\eta_{000}) = -0.003 \pm 0.013 \pm 0.017$ with a statistical correlation coefficient of 0.77 and an overall correlation coefficient of 0.57 between imaginary and real part. The equivalent limit is $ \eta_{000} < 0.045$ at 90% CL.					
² ANGELOPOULOS 98B assumes $\text{Re}(\eta_{000}) = \text{Re}(\epsilon) = 1.635 \times 10^{-3}$. Without assuming CPT invariance, they obtain $\text{Re}(\eta_{000}) = 0.18 \pm 0.14 \pm 0.06$ and $\text{Im}(\eta_{000}) = 0.15 \pm 0.20 \pm 0.03$.					

$$|\eta_{000}| = |A(K_S^0 \rightarrow 3\pi^0) / A(K_L^0 \rightarrow 3\pi^0)|$$

A non-zero value violates CP invariance.

DECAY-PLANE ASYMMETRY IN $\pi^+\pi^-e^+e^-$ DECAYS

This is the CP -violating asymmetry

$$A = \frac{N_{\sin\phi\cos\phi>0.0} - N_{\sin\phi\cos\phi<0.0}}{N_{\sin\phi\cos\phi>0.0} + N_{\sin\phi\cos\phi<0.0}}$$

where ϕ is the angle between the e^+e^- and $\pi^+\pi^-$ planes in the K_S^0 rest frame.

$$CP \text{ asymmetry } A \text{ in } K_S^0 \rightarrow \pi^+\pi^-e^+e^-$$

K_L^0

$$I(J^P) = \frac{1}{2}(0^-)$$

$$m_{K_L^0} - m_{K_S^0}$$

For earlier measurements, beginning with GOOD 61 and FITCH 61, see our 1986 edition, Physics Letters **170B** 132 (1986).

OUR FIT is described in the note on "CP violation in K_L decays" in the K^0 Particle Listings. The result labeled "OUR FIT Assuming CPT" ["OUR FIT Not assuming CPT"] includes all measurements except those with the comment "Not assuming CPT" ["Assuming CPT"]. Measurements with neither comment do not assume CPT and enter both fits.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- 1 The two ABOUZAID 11 values use the same data. The first enters the "assuming CPT" fit and the second enters the "not assuming CPT" fit.
- 2 ABOUZAID 11 fit has Δm , τ_S , ϕ_c , $\text{Re}(e'/\epsilon)$, and $\text{Im}(e'/\epsilon)$ as free parameters. See $\text{Im}(e'/\epsilon)$ in the " K_L^0 CP violation" section for correlation information.
- 3 ABOUZAID 11 fit has Δm and τ_S free but constrains ϕ_c to the Superweak value, i.e. assumes CPT. See " K_S^0 Mean Life" section for correlation information.
- 4 Fits Δm and ϕ_{+-} simultaneously. GIBBONS 93c systematic error is from B. Winstein via private communication. 20-160 GeV K beams.
- 5 GIBBONS 93 value assume $\phi_{+-} = \phi_{00} = \phi_{SW} = (43.7 \pm 0.2)^\circ$, i.e. assumes CPT. 20-160 GeV K beams.
- 6 These two experiments have a common systematic error due to the uncertainty in the momentum scale, as pointed out in WAHL 89.
- 7 GJESDAL 74 uses charge asymmetry in K_{e3}^0 decays.
- 8 ALAVI-HARATI 03 fit Δm and $\tau_{K_S^0}$ simultaneously. ϕ_{+-} is constrained to the Superweak value, i.e. CPT is assumed. See " K_S^0 Mean Life" section for correlation information. Superseded by ABOUZAID 11.
- 9 ALAVI-HARATI 03 fit Δm , ϕ_{+-} , and $\tau_{K_S^0}$ simultaneously. See ϕ_{+-} in the " K_L^0 CP violation" section for correlation information. Superseded by ABOUZAID 11.
- 10 ANGELOPOULOS 01 uses strong interactions strangeness tagging at two different times.
- 11 Uses K_{e3}^0 and K_{e3}^0 strangeness tagging at production and decay. Assumes CPT conservation on $\Delta S = -\Delta Q$ transitions.
- 12 ADLER 96c is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value above.
- 13 ARONSON 82 find that Δm may depend on the kaon energy.
- 14 ARONSON 70 and CARNEGIE 71 use K_S^0 mean life = $(0.862 \pm 0.006) \times 10^{-10} \text{ s}$. We have not attempted to adjust these values for the subsequent change in the K_S^0 mean life or in η_{+-} .

K_L^0 MEAN LIFE

VALUE (10^{-8} s)	EVTS	DOCUMENT ID	TECN	COMMENT																																				
5.116 ± 0.021 OUR FIT	Error includes scale factor of 1.1.

<p>1 AMBROSINO 06 uses $\phi \rightarrow K_L K_S$ with K_L tagged by $K_S \rightarrow \pi^+ \pi^-$. The four major K_L BR's are measured, the small remainder ($\pi^+ \pi^-, \pi^0 \pi^0, \gamma \gamma$) is taken from PDG 04. This KLOE K_L lifetime is obtained by imposing $\sum_i B_i = 1$. The correlation matrix among the four measured K_L BR's and this K_L lifetime is</p> <table border="1"> <tr> <td></td> <td>K_{e3}</td> <td>$K_{\mu 3}$</td> <td>$3\pi^0$</td> <td>$\pi^+ \pi^- \pi^0$</td> <td>τ_{K_L}</td> </tr> <tr> <td>K_{e3}</td> <td>1</td> <td>-0.25</td> <td>-0.56</td> <td>-0.07</td> <td>0.25</td> </tr> <tr> <td>$K_{\mu 3}$</td> <td></td> <td>1</td> <td>-0.43</td> <td>-0.20</td> <td>0.33</td> </tr> <tr> <td>$3\pi^0$</td> <td></td> <td></td> <td>1</td> <td>-0.39</td> <td>-0.21</td> </tr> <tr> <td>$\pi^+ \pi^- \pi^0$</td> <td></td> <td></td> <td></td> <td>1</td> <td>-0.39</td> </tr> <tr> <td>τ_{K_L}</td> <td></td> <td></td> <td></td> <td></td> <td>1</td> </tr> </table>						K_{e3}	$K_{\mu 3}$	$3\pi^0$	$\pi^+ \pi^- \pi^0$	τ_{K_L}	K_{e3}	1	-0.25	-0.56	-0.07	0.25	$K_{\mu 3}$		1	-0.43	-0.20	0.33	$3\pi^0$			1	-0.39	-0.21	$\pi^+ \pi^- \pi^0$				1	-0.39	τ_{K_L}					1

- [a] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [b] This mode includes gammas from inner bremsstrahlung but not the direct emission mode $K_L^0 \rightarrow \pi^+ \pi^- \gamma$ (DE).
- [c] See the Particle Listings below for the energy limits used in this measurement.
- [d] Most of this radiative mode, the low-momentum γ part, is also included in the parent mode listed without γ 's.
- [e] Allowed by higher-order electroweak interactions.
- [f] Violates CP in leading order. Test of direct CP violation since the indirect CP-violating and CP-conserving contributions are expected to be suppressed.

CONSTRAINED FIT INFORMATION

An overall fit to the mean life and 15 branching ratios uses 27 measurements and one constraint to determine 11 parameters. The overall fit has a $\chi^2 = 37.4$ for 17 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$\Gamma(\pi^0 e^+ e^-)/\Gamma_{\text{total}}$ Γ_{31}/Γ

Violates CP in leading order. Direct and indirect CP-violating contributions are expected to be comparable and to dominate the CP-conserving part. LAI 02B result suggests that CP-violation effects dominate. Test for $\Delta S = 1$ weak neutral current. Allowed by higher-order electroweak interaction.

¹ AHN 19 result is based on data collected in 2015, which corresponds to 2.2×10^{19} protons on target. A single event sensitivity of $(1.30 \pm 0.01 \pm 0.14) \times 10^{-9}$ was achieved with no candidate events observed. An upper limit of $< 2.4 \times 10^{-9}$ at the 90% C.L. for the $K_L^0 \rightarrow \pi^0 X^0$ decay was also set, where X^0 is an invisible particle with a mass of 135 MeV/ c^2 .

² AHN 17 result is based on the first 100 hours of physics running in 2013. One candidate event was observed with an expected background of 0.34 ± 0.16 events. An upper limit of $< 3.7 \times 10^{-8}$ at the 90% C.L. for the $K_L^0 \rightarrow \pi^0 X^0$ decay was also set, where X^0 is an invisible particle with a mass of 135 MeV/ c^2 .

³ Obtained combining Run-2 (AHN 08) and Run-3 data.

⁴ Value obtained using data from February to April 2005.

⁵ Value obtained analyzing 10% of data of RUN 1 (performed in 2004).

-3.3 ± 1.1 ± 0.7	5M	^{2,3} SOMALWAR	92 E731

- Result obtained using Cl3pl model of CABIBBO 05 to include $\pi\pi$ rescattering effects. The systematic error includes an external error of 1.06×10^{-3} from the parametrization input of $(a_0 - a_2) m_{\pi^+} = 0.268 \pm 0.017$ from BATLEY 06B.
- LAI 01B and SOMALWAR 92 results do not include $\pi\pi$ final state rescattering effects.
- SOMALWAR 92 chose m_{π^+} as normalization to make it compatible with the Particle Data Group $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$ definitions.

K_L^0 FORM FACTORS

For discussion, see note on form factors in the K^\pm section of the Particle Listings above.

In the form factor comments, the following symbols are used.

f_+ and f_- are form factors for the vector matrix element.

f_S and f_T refer to the scalar and tensor term.

$$f_0(t) = f_+(t) + f_-(t) t / (m_{K^0}^2 - m_{\pi^+}^2).$$

t = momentum transfer to the π .

λ_+ and λ_0 are the linear expansion coefficients of f_+ and f_0 :

$$f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$$

For quadratic expansion

$$f_+(t) = f_+(0) (1 + \lambda'_+ t / m_{\pi^+}^2 + \frac{\lambda''_+}{2} t^2 / m_{\pi^+}^4)$$

as used by KTeV. If there is a non-vanishing quadratic term, then λ_+ represents an average slope, which is then different from λ'_+ .

NA48 (K_{e3}) and ISTRA quadratic expansion coefficients are converted with

$$\lambda'_+ \text{ PDG} = \lambda_+ \text{ NA48} \text{ and } \lambda''_+ \text{ PDG} = 2 \lambda'_+ \text{ NA48}$$

$$\lambda'_+ \text{ PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+ \text{ ISTRA} \text{ and}$$

$$\lambda''_+ \text{ PDG} = 2 (\frac{m_{\pi^+}}{m_{\pi^0}})^4 \lambda''_+ \text{ ISTRA}$$

ISTRA linear expansion coefficients are converted with

$$\lambda_+ \text{ PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+ \text{ ISTRA} \text{ and } \lambda_0 \text{ PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_0 \text{ ISTRA}$$

The pole parametrization is

$$f_+(t) = f_+(0) (\frac{M_V^2}{M_V^2 - t})$$

$$f_0(t) = f_0(0) (\frac{M_S^2}{M_S^2 - t})$$

where M_V and M_S are the vector and scalar pole masses.

The dispersive parametrization is

$$f_+(t) = f_+(0) \exp[\frac{t}{m_\pi^2} (\Lambda_+ + H(t))];$$

$$f_0(t) = f_0(0) \exp[\frac{t}{m_K^2 - m_\pi^2} (\ln[C] - G(t))],$$

where Λ_+ is the slope parameter and $\ln[C] = \ln[f_0(m_K^2 - m_\pi^2)]$

is the logarithm of the scalar form factor at the Callan-Treiman point.

$H(t)$ and $G(t)$ are dispersive integrals.

The following abbreviations are used:

DP = Dalitz plot analysis.

PI = π spectrum analysis.

MU = μ spectrum analysis.

POL = μ polarization analysis.

BR = $K_{\mu 3}^0 / K_{e 3}^0$ branching ratio analysis.

E = positron or electron spectrum analysis.

RC = radiative corrections.

λ_+ (LINEAR ENERGY DEPENDENCE OF f_+ IN K_{e3}^0 DECAY)

α_{K^*} DECAY FORM FACTOR FOR $K_L \rightarrow \ell^+ \ell^- \gamma, K_L^0 \rightarrow \ell^+ \ell^- \ell^+ \ell^-$

Average of all α_{K^*} measurements (from each of three datablocks following this one) assuming lepton universality.

-0.205 ± 0.022 OUR AVERAGE Includes data from the 3 datablocks that follow this one. Error includes scale factor of 1.8. See the ideogram below.

α_{K^*} DECAY FORM FACTOR FOR $K_L \rightarrow \ell^+ \ell^- \gamma, K_L^0 \rightarrow \ell^+ \ell^- \ell^+ \ell^-$

α_{K^*} DECAY FORM FACTOR FOR $K_L \rightarrow e^+ e^- \gamma$

α_{K^*} is the constant in the model of BERGSTROM 83 which measures the relative strength of the vector-vector transition $K_L \rightarrow K^* \gamma$ with $K^* \rightarrow \rho, \omega, \phi \rightarrow \gamma^*$ and the pseudoscalar-pseudoscalar transition $K_L \rightarrow \pi, \eta, \eta' \rightarrow \gamma \gamma^*$.

The data in this block is included in the average printed for a previous datablock.

-0.217 ± 0.034 OUR AVERAGE Error includes scale factor of 2.4.

$\alpha_{K^*}^{eff}$ DECAY FORM FACTOR FOR $K_L \rightarrow e^+ e^- e^+ e^-$

$\alpha_{K^*}^{eff}$ is the parameter describing the relative strength of an intermediate pseudoscalar decay amplitude and a vector meson decay amplitude in the model of BERGSTROM 83. It takes into account both the radiative effects and the form factor. Since there are two $e^+ e^-$ pairs here compared with one in $e^+ e^- \gamma$ decays, a factorized expression is used for the $e^+ e^- e^+ e^-$ decay form factor.

The data in this block is included in the average printed for a previous datablock.

-0.14 ± 0.16 ± 0.15 441 ALAVI-HARATI01D KTEV

α_{DIP} DECAY FORM FACTOR FOR $K_L^0 \rightarrow \ell^+ \ell^- \gamma, K_L^0 \rightarrow \ell^+ \ell^- \ell^+ \ell^-$

Average of all α_{DIP} measurements (from each of three datablocks following this one) assuming lepton universality.

-1.69 ± 0.08 OUR AVERAGE Includes data from the 3 datablocks that follow this one. Error includes scale factor of 1.7.

α_{DIP} DECAY FORM FACTOR FOR $K_L^0 \rightarrow e^+ e^- \gamma$

α_{DIP} parameter in $K_L^0 \rightarrow \gamma^* \gamma^*$ form factor by DAMBROSIO 98, motivated by vector meson dominance and a proper short distance behavior.

The data in this block is included in the average printed for a previous datablock.

-1.729 ± 0.043 ± 0.028 83k ABOUZAID 07B KTEV

α_{DIP} DECAY FORM FACTOR FOR $K_L^0 \rightarrow \mu^+ \mu^- \gamma$

α_{DIP} is a constant in the model of DAMBROSIO 98 described in the previous section.

The data in this block is included in the average printed for a previous datablock.

-1.54 ± 0.10 9100 ALAVI-HARATI01G KTEV

α_{DIP} DECAY FORM FACTOR FOR $K_L^0 \rightarrow e^+ e^- \mu^+ \mu^-$

α_{DIP} is a constant in the model of DAMBROSIO 98 described in the previous section.

The data in this block is included in the average printed for a previous datablock.

-1.59 ± 0.37 131 ALAVI-HARATI03B KTEV

a_1/a_2 FORM FACTOR FOR M1 DIRECT EMISSION AMPLITUDE

Form factor = $\tilde{g}_{M1} [1 + \frac{a_1/a_2}{(M_p^2 - M_K^2) + 2M_K E_\gamma}]$ as described in ALAVI-HARATI 00b.

CP Violation in K_L^0 Decays

CP-VIOLATION PARAMETERS IN K_L^0 DECAYS**CHARGE ASYMMETRY IN K_{e3}^0 DECAYS**

Such asymmetry violates *CP*. It is related to $\text{Re}(\epsilon)$.

 A_L = weighted average of $A_L(\mu)$ and $A_L(e)$

In previous editions and in the literature the symbol used for this asymmetry was δ_L^{\pm} or δ . We use A_L for consistency with B^0 asymmetry notation and with recent K_S^0 notation.

PARAMETERS FOR $K_L^0 \rightarrow 2\pi$ DECAY

$$\eta_{+-} = A(K_L^0 \rightarrow \pi^+ \pi^-) / A(K_S^0 \rightarrow \pi^+ \pi^-)$$

$$\eta_{00} = A(K_L^0 \rightarrow \pi^0 \pi^0) / A(K_S^0 \rightarrow \pi^0 \pi^0)$$

The fitted values of $|\eta_{+-}|$ and $|\eta_{00}|$ given below are the results of a fit to $|\eta_{+-}|$, $|\eta_{00}|$, $|\eta_{00}/\eta_{+-}|$, and $\text{Re}(\epsilon'/\epsilon)$. Independent information on $|\eta_{+-}|$ and $|\eta_{00}|$ can be obtained from the fitted values of the $K_L^0 \rightarrow \pi\pi$ and $K_S^0 \rightarrow \pi\pi$ branching ratios and the K_L^0 and K_S^0 lifetimes. This information is included as data in the $|\eta_{+-}|$ and $|\eta_{00}|$ sections with a Document ID "BRFIT." See the note "CP violation in K_L decays" above for details.

 $|\eta_{00}| = |A(K_L^0 \rightarrow 2\pi^0) / A(K_S^0 \rightarrow 2\pi^0)|$

¹ Value obtained from the NA48 measurements of $\Gamma(K_L^0 \rightarrow \pi^+ \pi^-)/\Gamma(K_L^0 \rightarrow \pi^+ \nu_e)$ and $\tau_{K_S^0}$ and KLOE measurements of $B(K_S^0 \rightarrow \pi^+ \pi^-)$ and $\tau_{K_L^0}$. $\Gamma(K_L^0 \rightarrow \pi^+ \pi^-)$ is defined to include the inner bremsstrahlung component $\Gamma(K_L^0 \rightarrow \pi^+ \pi^- \gamma(\text{IB}))$ but exclude the direct emission component $B(K_S^0 \rightarrow \pi^+ \pi^- (\text{DE}))$. Their $|\eta_{+-}|$ value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.

² AMBROSINO 06F uses KLOE branching ratios and τ_L together with τ_S from PDG 04. Their $|\eta_{+-}|$ value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.

³ ALEXOPOULOS 04 $|\eta_{+-}|$ uses their $K_L^0 \rightarrow \pi\pi$ branching fractions, $\tau_S = (0.8963 \pm 0.0005) \times 10^{-10}$ s from the average of KTeV and NA48 τ_S measurements, and assumes that $\Gamma(K_S^0 \rightarrow \pi\ell\nu_\ell) = \Gamma(K_L^0 \rightarrow \pi\ell\nu_\ell)$ giving $B(K_S^0 \rightarrow \pi\ell\nu_\ell) = 0.118\%$. Their η_{+-} is not directly used in our fit, but enters our fit via their branching ratio measurements.

⁴ APOSTOLAKIS 99C report $(2.264 \pm 0.023 \pm 0.026 + 9.1[\tau_S - 0.8934]) \times 10^{-3}$. We evaluate for our 2006 best value $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$ s.

⁵ ADLER 95B report $(2.312 \pm 0.043 \pm 0.030 - 1[\Delta m - 0.5274] + 9.1[\tau_S - 0.8926]) \times 10^{-3}$. We evaluate for our 1996 best values $\Delta m = (0.5304 \pm 0.0014) \times 10^{-10} \text{ns}^{-1}$ and $\tau_S = (0.8927 \pm 0.0009) \times 10^{-10}$ s. Superseded by APOSTOLAKIS 99C.

 $|\epsilon| = (2|\eta_{+-}| + |\eta_{00}|)/3$

This expression is a very good approximation, good to about one part in 10^{-4} because of the small measured value of $\phi_{00} - \phi_{+-}$ and small theoretical ambiguities.

VALUE (units 10^{-3})	DOCUMENT ID	COMMENT

Meson Particle Listings

K_L^0

- 2 These values are derived from $|\eta_{00}/\eta_{+-}|$ measurements. They enter the average in this section but enter the fit via the $|\eta_{00}/\eta_{+-}|$ only.
- 3 This is the combined results from BARR 93D and BURKHARDT 88, taking into account their common systematic uncertainty.
- 4 We use ABOUZAID 11 $\text{Re}(\epsilon'/\epsilon)$ value with *CPT* assumption in our fits for $|\eta_{+-}|$, $|\eta_{00}|$, and $\text{Re}(\epsilon'/\epsilon)$.
- 5 These values are derived from $|\eta_{00}/\eta_{+-}|$ measurements.

- 6 GEWENIGER 74B measures $\phi_{+-} = (49.4 \pm 1.0) + 565 [\Delta m - 0.540]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- 7 Not independent of other phase parameters reported in ABOUZAID 11.
- 8 ALAVI-HARATI 03 ϕ_{+-} is correlated with their $\Delta m = m_{K_L^0} - m_{K_S^0}$ and τ_{K_S} measurements in the K_L^0 and K_S^0 sections respectively. The correlation coefficients are $\rho(\phi_{+-}, \Delta m) = +0.955$, $\rho(\phi_{+-}, \tau_S) = -0.871$, and $\rho(\tau_S, \Delta m) = -0.840$. *CPT* is not assumed. Uses scintillator Pb regenerator. Superseded by ABOUZAID 11.
- 9 ADLER 96C measures $\phi_{+-} = (43.82 \pm 0.41) + 339 [\Delta m - 0.5307] - 252 [\tau_S - 0.8922]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{ s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- 10 ADLER 96C is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value in the 1996 edition of this Review (Physical Review **D54** 1 (1996)).
- 11 ADLER 95B measures $\phi_{+-} = (42.7 \pm 0.9 \pm 0.6) + 316 [\Delta m - 0.5274] + 30 [\tau_S - 0.8926]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{ s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- 12 ADLER 92B quote separately two systematic errors: ± 0.4 from their experiment and ± 1.0 degrees due to the uncertainty in the value of Δm .
- 13 KARLSSON 90 systematic error does not include regeneration phase uncertainty.
- 14 CARITHERS 75 measures $\phi_{+-} = (45.5 \pm 2.8) + 224 [\Delta m - 0.5348]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values. $\phi_f = -40.9 \pm 2.6^\circ$.

ϕ_{+-} , PHASE OF η_{+-}

The dependence of the phase on Δm and τ_S is given for each experiment in the comments below, where Δm is the $K_L^0 - K_S^0$ mass difference in units 10^{10} h s^{-1} and τ_S is the K_S mean life in units 10^{-10} s . We also give the regeneration phase ϕ_f in the comments below.

OUR FIT is described in the note on "CP violation in K_L decays" in the K_L^0 Particle Listings. Most experiments in this section are included in both the "Not Assuming *CPT*" and "Assuming *CPT*" fits. In the latter fit, they have little direct influence on ϕ_{+-} because their errors are large compared to that assuming *CPT*, but they influence Δm and τ_S through their dependencies on these parameters, which are given in the footnotes.

- 1 APOSTOLAKIS 99c measures $\phi_{+-} = (43.19 \pm 0.53 \pm 0.28) + 300 [\Delta m - 0.5301]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- 2 SCHWINGENHEUER 95 measures $\phi_{+-} = (43.53 \pm 0.76) + 173 [\Delta m - 0.5282] - 275 [\tau_S - 0.8926]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{ s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- 3 These experiments measure $\phi_{+-} - \phi_f$ and calculate the regeneration phase from the power law momentum dependence of the regeneration amplitude using analyticity and dispersion relations. SCHWINGENHEUER 95 [GIBBONS 93] includes a systematic error of $0.35^\circ [0.5^\circ]$ for uncertainties in their modeling of the regeneration amplitude.
- 4 GIBBONS 93 measures $\phi_{+-} = (42.21 \pm 0.9) + 189 [\Delta m - 0.5257] - 460 [\tau_S - 0.8922]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{ s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values. This is actually reported in SCHWINGENHEUER 95, footnote 8. GIBBONS 93 reports $\phi_{+-} (42.2 \pm 1.4)^\circ$. They measure $\phi_{+-} - \phi_f$ and calculate the regeneration phase ϕ_f from the power law momentum dependence of the regeneration amplitude using analyticity. An error of 0.6° is included for possible uncertainties in the regeneration phase.
- 5 CAROSI 90 measures $\phi_{+-} = (46.9 \pm 1.4 \pm 0.7) + 579 [\Delta m - 0.5351] + 303 [\tau_S - 0.8922]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{ s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

ϕ_{00} , PHASE OF η_{00}

See comment in ϕ_{+-} header above for treatment of Δm and τ_S dependence, as well as for the inclusion of data in both the "Assuming *CPT*" and "Not Assuming *CPT*" fits.

OUR FIT is described in the note on "CP violation in K_L decays" in the K_L^0 Particle Listings.

VALUE ($^\circ$)	DOCUMENT ID	TECN	COMMENT
43.52 ± 0.05 OUR FIT			Error includes scale factor of 1.3. Assuming <i>CPT</i>

50.8 ± 7.1 ± 1.7	⁴ ADLER 96B	CPLR	Sup. by ANGELOPOULOS 98
47.4 ± 1.4 ± 0.9	⁵ KARLSSON 90	E731	
¹ CAROSI 90 measures $\phi_{00} = (47.1 \pm 2.1 \pm 1.0) + 579 [\Delta m - 0.5351] + 252 [\tau_S - 0.8922]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{ s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.			
² Not independent of other phase parameters reported in ABOUZAID 11.			
³ ANGELOPOULOS 98 measures $\phi_{00} = (42.0 \pm 5.6 \pm 1.9) + 240 [\Delta m - 0.5307]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values. The τ_S dependence is negligible.			
⁴ ADLER 96B identified initial neutral kaon individually as being a K^0 or a \bar{K}^0 . The systematic uncertainty is $\pm 1.5^\circ$ combined in quadrature with $\pm 0.8^\circ$ due to Δm .			
⁵ KARLSSON 90 systematic error does not include regeneration phase uncertainty.			

$\phi_\epsilon = (2\phi_{+-} + \phi_{00})/3$

This expression is a very good approximation, good to about 10^{-3} degrees because of the small measured values of $\phi_{00} - \phi_{+-}$ and $\text{Re}(\epsilon'/\epsilon)$, and small theoretical ambiguities.

VALUE ($^\circ$)	DOCUMENT ID	TECN	COMMENT
43.52 ± 0.05 OUR FIT			Error includes scale factor of 1.2. Assuming <i>CPT</i>
43.5 ± 0.5 OUR FIT			Error includes scale factor of 1.3. Not assuming <i>CPT</i>
43.5164 ± 0.0002 ± 0.0518	¹ SUPERWEAK 16		Assuming <i>CPT</i>
43.86 ± 0.63	² ABOUZAID 11	KTEV	Not assuming <i>CPT</i>
¹ SUPERWEAK 16 is a fake measurement used to impose the <i>CPT</i> or Superweak constraint $\phi_{+-} = \phi_{\text{SW}} = \tan^{-1} [2 \frac{\Delta m}{\hbar} (\frac{\tau_S \tau_L}{\tau_S - \tau_L})]$. This "measurement" is linearized using values near the PDG 04 edition values of Δm , τ_S and τ_L , and then adjusted to our current values as described in the following "measurement". SUPERWEAK 16 measures $\phi_\epsilon = (43.50258 \pm 0.00021) + 54.1 [\Delta m - 0.5289] + 32.0 [\tau_S - 0.89564]^\circ$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ h s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{ s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.			
² ABOUZAID 11 uses the full KTeV dataset collected in 1996, 1997, and 1999. See $\text{Im}(\epsilon'/\epsilon)$ section for correlation information.			

$\text{Im}(\epsilon'/\epsilon) = -(\phi_{00} - \phi_{+-})/3$

For small $|\epsilon'/\epsilon|$, $\text{Im}(\epsilon'/\epsilon)$ is related to the phases of η_{00} and η_{+-} by the above expression.

VALUE ($^\circ$)	DOCUMENT ID	TECN	COMMENT
-0.002 ± 0.005 OUR FIT			Error includes scale factor of 1.7. Assuming <i>CPT</i>

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹ CLARK 77 value has additional $\xi(0)$ dependence $+0.21\text{Re}[\xi(0)]$.
² SANDWEISS 73 value corrected from value quoted in their paper due to new value of $\text{Re}(\xi)$. See footnote 4 of SCHMIDT 79.

CPT-INVARIANCE TESTS IN K_L^0 DECAYSPHASE DIFFERENCE $\phi_{00} - \phi_{+-}$ Test of CPT .OUR FIT is described in the note on " CP violation in K_L decays" in the K_L^0 Particle Listings.

VALUE (°)	DOCUMENT ID	TECN	COMMENT
0.006 ± 0.014 OUR FIT			Error includes scale factor of 1.7. Assuming CPT
0.34 ± 0.32 OUR FIT			Not assuming CPT
0.006 ± 0.008	¹ SUPERWEAK 16		Assuming CPT
-0.30 ± 0.88	² SCHWINGEN...95		Combined E731, E773
0.30 ± 0.35	³ ABOUZAID 11	KTEV	Not assuming CPT
0.39 ± 0.22 ± 0.45	⁴ ALAVI-HARATI03	KTEV	
0.62 ± 0.71 ± 0.75	SCHWINGEN...95	E773	
-1.6 ± 1.2	⁵ GIBBONS 93	E731	
0.2 ± 2.6 ± 1.2	⁶ CAROSI 90	NA31	
-0.3 ± 2.4 ± 1.2	KARLSSON 90	E731	

- ¹ SUPERWEAK 16 is a fake experiment to constrain $\phi_{00} - \phi_{+-}$ to a small value as described in the note " CP violation in K_L decays."
- ² This SCHWINGENHEUER 95 values is the combined result of SCHWINGENHEUER 95 and GIBBONS 93, accounting for correlated systematic errors.
- ³ Not independent of other phase parameters reported in ABOUZAID 11.
- ⁴ ALAVI-HARATI 03 fit $\text{Re}(\epsilon'/\epsilon)$, $\text{Im}(\epsilon'/\epsilon)$, Δm , τ_S , and ϕ_{+-} simultaneously, not assuming CPT . Phase difference is obtained from $\phi_{00} - \phi_{+-} \approx -3\text{Im}(\epsilon'/\epsilon)$ for small $|\epsilon'/\epsilon|$. Superseded by ABOUZAID 11.
- ⁵ GIBBONS 93 give detailed dependence of systematic error on lifetime (see the section on the K_S^0 mean life) and mass difference (see the section on $m_{K_L^0} - m_{K_S^0}$).
- ⁶ CAROSI 90 is excluded from the fit because it is not independent of ϕ_{+-} and ϕ_{00} values.

PHASE DIFFERENCE $\phi_{+-} - \phi_{SW}$ Test of CPT . The Superweak phase $\phi_{SW} \equiv \tan^{-1}(2\Delta m/\Delta\Gamma)$ where $\Delta m = m_{K_L^0} - m_{K_S^0}$ and $\Delta\Gamma = \hbar(\tau_L - \tau_S)/(\tau_L\tau_S)$.

VALUE (°)	DOCUMENT ID	TECN
0.61 ± 0.62 ± 1.01	¹ ALAVI-HARATI03	KTEV

¹ ALAVI-HARATI 03 fit is the same as their ϕ_{+-} , τ_{K_S} , Δm fit, except that the parameter $\phi_{+-} - \phi_{SW}$ is used in place of ϕ . $\text{Re}(\frac{2}{3}\eta_{+-} + \frac{1}{3}\eta_{00}) - \frac{A_L}{2}$

VALUE (units 10^{-6})	DOCUMENT ID	TECN	COMMENT
-3 ± 35	¹ ALAVI-HARATI02	E799	Uses A_L from K_{e3} decays

¹ ALAVI-HARATI 02 uses PDG 00 values of η_{+-} and η_{00} .

 $\Delta S = \Delta Q$ IN K^0 DECAYSThe relative amount of $\Delta S \neq \Delta Q$ component present is measured by the parameter x , defined as

$$x = A(\bar{K}^0 \rightarrow \pi^-\ell^+\nu)/A(K^0 \rightarrow \pi^-\ell^+\nu)$$

We list $\text{Re}\{x\}$ and $\text{Im}\{x\}$ for K_{e3} and $K_{\mu 3}$ combined.

$$x = A(\bar{K}^0 \rightarrow \pi^-\ell^+\nu)/A(K^0 \rightarrow \pi^-\ell^+\nu) = A(\Delta S = -\Delta Q)/A(\Delta S = \Delta Q)$$

$K_0^{*0}(700)$

$I(J^P) = \frac{1}{2}(0^+)$

also known as κ ; was $K_0^{*0}(800)$

Needs confirmation. See the mini-review on scalar mesons under $f_0(500)$ (see the index for the page number).

$K_0^{*0}(700)$ T-Matrix Pole \sqrt{s}

- 1 Extracted from Forward Dispersion Relations using sequences of Pade approximants .
- 2 Extracted from Breit-Wigner parameters.
- 3 Fit to scattering phase shifts using UChPT amplitudes with explicit resonances.
- 4 Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06c, AITALA 06, and LINK 09 using an s-dependent width with couplings to $K\pi$ and $K\eta'$, and the Adler zero near thresholds.
- 5 From a complex pole included in the fit. Using parameters from the model that fits data best.
- 6 Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06c using for the κ an s-dependent width with an Adler zero near threshold.
- 7 Using Roy-Steiner equations (ROY 71) consistent with unitarity, analyticity and crossing symmetry constraints.
- 8 From UChPT fitted to MERCER 71, BINGHAM 72 and ESTABROOKS 78. Amplitude shown to be consistent with data of ABLIKIM 06c.
- 9 Reanalysis of ASTON 88 data.
- 10 Reanalysis of data from LINGLIN 73, ESTABROOKS 78, and ASTON 88 using the Inverse Amplitude Method.
- 11 Reanalysis of ASTON 88 using interfering Breit-Wigner amplitudes. Extracted from Breit-Wigner parameters.
- 12 Unitarized Quark Model.

• • • We do not use the following data for averages, fits, limits, etc. • • •				
888.0 ± 1.9	141k	6 BONVICINI 08A	CLEO	$D^+ \rightarrow K^- \pi^+ \pi^+$
$856 \pm 17 \pm 13$	54k	7 LINK 07B	FOCS	$D^+ \rightarrow K^- \pi^+ \pi^+$
855 ± 15	0.6k	8 CAWLFIELD 06A	CLEO	$D^0 \rightarrow K^+ K^- \pi^0$
905^{+65}_{-30}		9 ISHIDA 97B	RVUE	11 $K^- \rho \rightarrow K^- \pi^+ n$

- 1 The Breit-Wigner parameters from a fit with seven intermediate resonances. The S-matrix pole position is $(764 \pm 63^{+71}_{-54}) - i (306 \pm 149^{+143}_{-85})$ MeV.
- 2 From a fit including ten additional resonances and energy-independent Breit-Wigner width.
- 3 A fit in the $K_0^{*0}(700) + K^*(892) + K^*(1410)$ model with mass and width of the $K_0^{*0}(700)$ from ABLIKIM 06c well describes the left slope of the $K_S^0 \pi^-$ invariant mass spectrum in $\tau^- \rightarrow K_S^0 \pi^- \nu_\tau$ decay studied by EPIFANOV 07. Averaged value from different parameterizations.

- 4 Not seen by KOPP 01 using 7070 events of $D^0 \rightarrow K^- \pi^+ \pi^0$. LINK 02e and LINK 05i show clear evidence for a constant non-resonant scalar amplitude rather than $K_0^{*0}(700)$ in their high statistics analysis of $D^+ \rightarrow K^- \pi^+ \mu^+ \nu_\mu$.
- 5 AUBERT 07r does not find evidence for the charged $K_0^{*0}(700)$ using 11k events of $D^0 \rightarrow K^- K^+ \pi^0$.
- 6 Using parameters from the model that fits data best.
- 7 A Breit-Wigner mass and width.
- 8 Breit-Wigner parameters. A significant S-wave can be also modeled as a non-resonant contribution.
- 9 Reanalysis of ASTON 88 using interfering Breit-Wigner amplitudes.

545^{+235}_{-110}		9 ISHIDA 97B	RVUE	11 $K^- \rho \rightarrow K^- \pi^+ n$

- 1 The Breit-Wigner parameters from a fit with seven intermediate resonances. The S-matrix pole position is $(764 \pm 63^{+71}_{-54}) - i (306 \pm 149^{+143}_{-85})$ MeV.
- 2 From a fit including ten additional resonances and energy-independent Breit-Wigner width.
- 3 A fit in the $K_0^{*0}(700) + K^*(892) + K^*(1410)$ model with mass and width of the $K_0^{*0}(700)$ from ABLIKIM 06c well describes the left slope of the $K_S^0 \pi^-$ invariant mass spectrum in $\tau^- \rightarrow K_S^0 \pi^- \nu_\tau$ decay studied by EPIFANOV 07. Averaged value from different parameterizations.
- 4 Not seen by KOPP 01 using 7070 events of $D^0 \rightarrow K^- \pi^+ \pi^0$. LINK 02e and LINK 05i show clear evidence for a constant non-resonant scalar amplitude rather than $K_0^{*0}(700)$ in their high statistics analysis of $D^+ \rightarrow K^- \pi^+ \mu^+ \nu_\mu$.
- 5 AUBERT 07r does not find evidence for the charged $K_0^{*0}(700)$ using 11k events of $D^0 \rightarrow K^- K^+ \pi^0$.
- 6 Using parameters from the model that fits data best.
- 7 A Breit-Wigner mass and width.
- 8 Statistical error only. A fit to the Dalitz plot including the $K_0^{*0}(700)^\pm, K^*(892)^\pm$, and ϕ resonances modeled as Breit-Wigners. A significant S-wave can be also modeled as a non-resonant contribution.
- 9 Reanalysis of ASTON 88 using interfering Breit-Wigner amplitudes.

$K^*(892)$ MASSES AND MASS DIFFERENCES

Unrealistically small errors have been reported by some experiments. We use simple “realistic” tests for the minimum errors on the determination of a mass and width from a sample of N events:

$$\delta_{\min}(m) = \frac{\Gamma}{\sqrt{N}}, \quad \delta_{\min}(\Gamma) = 4 \frac{\Gamma}{\sqrt{N}}. \quad (1)$$

We consistently increase unrealistic errors before averaging. For a detailed discussion, see the 1971 edition of this Note.

K*(892)

m_{K*(892)^0} - m_{K*(892)^±}

CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 13 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 7.8$ for 11 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

~1450.0	MARTIN	78	SPEC	10	$K^\pm p \rightarrow K_S^0 \pi p$

- Using both $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+\pi^-\pi^0$. From a likelihood scan in the presence of several interfering scalar-meson resonances with fixed width $\Gamma(K_0^*(1430)) = 210$ MeV.
- S-matrix pole. Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06c, AITALA 06, and LINK 09 using an s-dependent width with couplings to $K\pi$ and $K\eta'$, and the Adler zero near thresholds.
- From the isobar model with a complex pole for the κ .
- From a non-parametric analysis.
- A Breit-Wigner mass and width.
- S-matrix pole. Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06c including the κ with an s-dependent width and an Adler zero near threshold.
- S-matrix pole. Using ASTON 88 and assuming $K_0^*(700)$, $K_0^*(1950)$.
- Using ASTON 88 and assuming $K_0^*(700)$.
- T-matrix pole. Reanalysis of ASTON 88 data.
- Breit-Wigner fit. Using ASTON 88.
- Assuming a low-mass scalar $K\pi$ resonance, $\kappa(700)$.
- T-matrix pole. Using data from ESTABROOKS 78 and ASTON 88.
- J^P not determined, could be $K_2^*(1430)$.
- T-matrix pole.
- Uses a model for the background, without this background they get a mass 1340 MeV, where the phase shift passes 90°.
- Mass defined by pole position. From elastic $K\pi$ partial-wave analysis.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 10 branching ratios uses 32 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 21.1$ for 25 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 4 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 2.9$ for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$$\begin{matrix} x_2 & \begin{matrix} -36 \\ -39 \end{matrix} \\ x_3 & \begin{matrix} -39 & -72 \end{matrix} \\ & x_1 & x_2 \end{matrix}$$

6 From energy-independent partial-wave analysis.
 7 From a fit to Y_6^2 moment. $J^P = 3^-$ found.
 8 From a partial wave amplitude analysis.
 9 From a fit to Y_6^0 moment.
 10 Errors enlarged by us to $4\Gamma/\sqrt{N}$; see the note with the $K^*(892)$ mass.
 11 ESTABROOKS 78 find that BRANDENBURG 76D data are consistent with 175 MeV width. Not averaged.

CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 4 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 0.0$ for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$K(3100)$

$I^G(J^PC) = ?^?(?^{??})$

OMITTED FROM SUMMARY TABLE

Narrow peak observed in several ($\Lambda \bar{p} +$ pions) and ($\bar{\Lambda} p +$ pions) states in Σ^- Be reactions by BOURQUIN 86 and in np and nA reactions by ALEEV 93. Not seen by BOEHNLEIN 91. If due to strong decays, this state has exotic quantum numbers ($B=0, Q=+1, S=-1$ for $\Lambda \bar{p} \pi^+ \pi^+$ and $I \geq 3/2$ for $\Lambda \bar{p} \pi^-$). Needs confirmation.

¹BARLAG 90c estimates the systematic error to be negligible.

D^\pm DECAY MODES

Most decay modes (other than the semileptonic modes) that involve a neutral K meson are now given as K_S^0 modes, not as \bar{K}^0 modes. Nearly always it is a K_S^0 that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K_S^0) = \Gamma(\bar{K}^0)$.

Γ_{110}	$K^+ \bar{K}^*(892)^0$, $\bar{K}^*(892)^0 \rightarrow K^- \pi^+$	$(2.49 \pm_{-0.13}^{+0.08}) \times 10^{-3}$		Γ_{161}	$K^*(892)^- 2\mu^+$	L < 8.5	$\times 10^{-4}$ CL=90%
Γ_{111}	$K^+ \bar{K}_0^*(1430)^0$, $\bar{K}_0^*(1430)^0 \rightarrow$ $K^- \pi^+$	$(1.82 \pm 0.35) \times 10^{-3}$		Γ_{162}	Unaccounted decay modes	$(63.3 \pm 0.4) \%$	S=1.3
Γ_{112}	$K^+ \bar{K}_2^*(1430)^0$, $\bar{K}_2^* \rightarrow$ $K^- \pi^+$	$(1.6 \pm_{-0.8}^{+1.2}) \times 10^{-4}$		[a] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.			
Γ_{113}	$K^+ \bar{K}_0^*(700)$, $\bar{K}_0^* \rightarrow K^- \pi^+$	$(6.8 \pm_{-2.1}^{+3.5}) \times 10^{-4}$		[b] These subfractions of the $K^- 2\pi^+$ mode are uncertain: see the Particle Listings.			
Γ_{114}	$a_0(1450)^0 \pi^+$, $a_0^0 \rightarrow K^+ K^-$	$(4.5 \pm_{-1.8}^{+7.0}) \times 10^{-4}$		[c] Submodes of the $D^+ \rightarrow K^- 2\pi^+ \pi^0$ and $K_S^0 2\pi^+ \pi^-$ were studied by ANJOS 92C and COFFMAN 92B, but with at most 142 events for the first mode and 229 for the second – not enough for precise results. With nothing new for 18 years, we refer to our 2008 edition, Physics Letters B667 1 (2008), for those results.			
Γ_{115}	$\phi(1680) \pi^+$, $\phi \rightarrow K^+ K^-$	$(4.9 \pm_{-1.9}^{+4.0}) \times 10^{-5}$		[d] The unseen decay modes of the resonances are included.			
Γ_{116}	$K_S^0 K_S^0 \pi^+$	$(2.70 \pm 0.13) \times 10^{-3}$		[e] This is <i>not</i> a test for the $\Delta C=1$ weak neutral current, but leads to the $\pi^+ \ell^+ \ell^-$ final state.			
				[f] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.

1 ABLIKIM 14F obtain $|V_{cd}| \cdot f_{D^+} = (45.75 \pm 1.20 \pm 0.39)$ MeV, and using $|V_{cd}| = 0.22520 \pm 0.00065$ gets $f_{D^+} = (203.2 \pm 5.3 \pm 1.8)$ MeV.

2 EISENSTEIN 08, using the D^+ lifetime and assuming $|V_{cd}| = |V_{us}|$, gets $f_{D^+} = (205.8 \pm 8.5 \pm 2.5)$ MeV from this measurement.

3 ABLIKIM 05D finds a background-subtracted $2.67 \pm 1.74 D^+ \rightarrow \mu^+ \nu_\mu$ events, and from this obtains $f_{D^+} = 371 \pm \frac{+129}{-119} \pm 25$ MeV.

4 ARTUSO 05A obtains $f_{D^+} = 222.6 \pm 16.7 \pm \frac{+2.8}{-3.4}$ MeV from this measurement.

5 BONVICINI 04A finds eight events with an estimated background of one, and from the branching fraction obtains $f_{D^+} = 202 \pm 41 \pm 17$ MeV.

6 BAI 98B obtains $f_{D^+} = (300 \pm \frac{+180}{-150} \pm \frac{+80}{-40})$ MeV from this measurement.

1 ABLIKIM 15AF report $\Gamma(D^+ \rightarrow K_L e^+ \nu_e)/\Gamma_{\text{total}} = (4.481 \pm 0.027 \pm 0.103)\%$. See also the form-factor parameters near the end of this D^+ Listing.

2 See the form-factor parameters near the end of this D^+ Listing.

3 The ABLIKIM 05A result together with the $D^0 \rightarrow K^- e^+ \nu_e$ branching fraction of ABLIKIM 04C and Particle Data Group lifetimes gives $\Gamma(D^0 \rightarrow K^- e^+ \nu_e) / \Gamma(D^+ \rightarrow \bar{K}^0 e^+ \nu_e) = 1.08 \pm 0.22 \pm 0.07$; isospin invariance predicts the ratio is 1.0.

4 DOBBS 08 establishes $|\frac{V_{cd}}{V_{cs}} \cdot \frac{f_{D^+}}{f_{D^0}}| = 0.188 \pm 0.008 \pm 0.002$ from the D^+ and D^0 decays to $\bar{K}^0 e^+ \nu_e$ and $\pi^+ e^+ \nu_e$. It also finds $\Gamma(D^0 \rightarrow K^- e^+ \nu_e) / \Gamma(D^+ \rightarrow \bar{K}^0 e^+ \nu_e) = 1.06 \pm 0.02 \pm 0.03$; isospin invariance predicts the ratio is 1.0.

6.4 $^{+1.5}_{-1.4}$		³ BARLAG	92c ACCM π^- Cu 230 GeV
9.1 ± 1.3 ± 0.4	1164	ADLER	88c MRK3 e^+e^- 3.77 GeV
9.1 ± 1.9	239	⁴ SCHINDLER	81 MRK2 e^+e^- 3.771 GeV

¹ DOBBS 07 and HE 05 use single- and double-tagged events in an overall fit. DOBBS 07 supersedes HE 05.

² BALEST 94 measures the ratio of $D^+ \rightarrow K^- \pi^+ \pi^+$ and $D^0 \rightarrow K^- \pi^+$ branching fractions to be $2.35 \pm 0.16 \pm 0.16$ and uses their absolute measurement of the $D^0 \rightarrow K^- \pi^+$ fraction (AKERIB 93).

³ BARLAG 92c computes the branching fraction by topological normalization.

⁴ SCHINDLER 81 (MARK-2) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.38 ± 0.05 nb. We use the MARK-3 (ADLER 88c) value of $\sigma = 4.2 \pm 0.6 \pm 0.3$ nb.

See the related review(s):
Review of Multibody Charm Analyses

$\Gamma((K^- \pi^+)_{S\text{-wave}} \pi^+)/\Gamma(K^- 2\pi^+)$		Γ_{49}/Γ_{48}	
This is the "fit fraction" from the Dalitz-plot analysis. The $K^- \pi^+$ S-wave includes a broad scalar κ ($\bar{K}_0^*(700)$), the $\bar{K}_0^*(1430)^0$, and non-resonant background.

0.8323 ± 0.0150 ± 0.0008	³ LINK	07B	FOCS See LINK 09
--------------------------	-------------------	-----	------------------

¹ This LINK 09 model-independent partial-wave analysis of the $K^- \pi^+$ S-wave slices the $K^- \pi^+$ mass range into 39 bins.

² The BONVICINI 08A QMIPWA (quasi-model-independent partial-wave analysis) of the $K^- \pi^+$ S-wave amplitude slices the $K^- \pi^+$ mass range into 26 bins but keeps the Breit-Wigner $\bar{K}_0^*(1430)^0$.

³ This LINK 07B fit uses a K matrix. The $K^- \pi^+$ S-wave fit fraction given above breaks down into (207.3 ± 25.5 ± 12.4)% isospin-1/2 and (40.5 ± 9.6 ± 3.2)% isospin-3/2 — with large interference between the two. The isospin-1/2 component includes the κ (or $\bar{K}_0^*(700)^0$) and $\bar{K}_0^*(1430)^0$.

VALUE	DOCUMENT ID	TECN	COMMENT
0.5600 ± 0.0324 ± 0.0214	1 LINK	04	FOCS Dalitz fit, 1527 ± 51 evts

¹ LINK 04 borrows a K-matrix parametrization from ANISOVICH 03 of the full $\pi-\pi$ S-wave isoscalar scattering amplitude to describe the $\pi^+ \pi^-$ S-wave component of the $\pi^+ \pi^+ \pi^-$ state. The fit fraction given above is a sum over five f_0 mesons, the $f_0(980)$, $f_0(1300)$, $f_0(1200-1600)$, $f_0(1500)$, and $f_0(1750)$. See LINK 04 for details and discussion.

 $D^\pm \chi^2$ TESTS OF CP -VIOLATION (CPV)

We list model-independent searches for local CP violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a χ^2 test comparing normalised yields N_i, \bar{N}_i in CP -conjugate bin pairs i : $\chi^2 = \sum_i (N_i - \alpha \bar{N}_i) / \sigma(N_i - \alpha \bar{N}_i)$. The factor $\alpha = (\sum_i N_i) / (\sum_i \bar{N}_i)$ removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured χ^2 or larger under the assumption of CP conservation [AUBERT 08AO, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAJ14C]. Results can be combined using Fisher's method [MOSTELLER 48].

CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

$A_{Tviol}(K_S^0 K^\pm \pi^+ \pi^-)$ in $D^\pm \rightarrow K_S^0 K^\pm \pi^+ \pi^-$

$C_T \equiv \bar{p}_{K^+} \cdot (\bar{p}_{\pi^+} \times \bar{p}_{\pi^-})$ is a parity-odd correlation of the K^+ , π^+ , and π^- momenta for the D^+ . $\bar{C}_T \equiv \bar{p}_{K^-} \cdot (\bar{p}_{\pi^-} \times \bar{p}_{\pi^+})$ is the corresponding quantity for the D^- . Then $A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$, and $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$, and $A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$. C_T and \bar{C}_T are commonly referred to as T-odd moments, because they are odd under T reversal. However, the T-conjugate process $K_S^0 K^\pm \pi^+ \pi^- \rightarrow D^\pm$ is not accessible, while the P-conjugate process is.

 D^0

$$I(J^P) = \frac{1}{2}(0^-)$$

 D^0 MASS

The fit includes $D^\pm, D^0, D_S^\pm, D^{*\pm}, D^{*0}, D_S^{*\pm}, D_1(2420)^0, D_2^*(2460)^0$, and $D_{S1}(2536)^\pm$ mass and mass difference measurements.

Given the recent addition of much more precise measurements, we have omitted all those masses published up through 1990. See any Review before 2015 for those earlier results.

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
1864.83 ± 0.05 OUR FIT				
1864.84 ± 0.05 OUR AVERAGE				
1864.845 ± 0.025 ± 0.057	63k	¹ TOMARADZE 14		$D^0 \rightarrow K^- 2\pi^+ \pi^-$
1864.75 ± 0.15 ± 0.11		AAIJ 13v	LHCB	$D^0 \rightarrow K^+ 2K^- \pi^+$

1864.847 ± 0.150 ± 0.095	0.3k	CAWLFIELD 07	CLEO	$D^0 \rightarrow K_S^0 \phi$

¹ Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration. The largest source of error in the TOMARADZE 14 value is from the uncertainties in the K^- and K_S^0 masses. The systematic error given above is the addition in quadrature of $\pm 0.022 \pm 0.053$ MeV, where the second error is from those mass uncertainties.

² The largest source of error in the LEES 13s value is from the uncertainty of the K^+ mass. The quoted systematic error is in fact $\pm 0.043 + 3 (m_{K^+} - 493.677)$, in MeV.

 $m_{D^\pm} - m_{D^0}$

The fit includes $D^\pm, D^0, D_S^\pm, D^{*\pm}, D^{*0}, D_S^{*\pm}, D_1(2420)^0, D_2^*(2460)^0$, and $D_{S1}(2536)^\pm$ mass and mass difference measurements.

 $D^0 - \bar{D}^0$ Mixing

$$|m_{D_1^0} - m_{D_2^0}| = x \Gamma$$

The D_1^0 and D_2^0 are the mass eigenstates of the D^0 meson, as described in the note on " $D^0 - \bar{D}^0$ Mixing," above. The experiments usually present $x \equiv \Delta m / \Gamma$. Then $\Delta m = x \Gamma = x \hbar / \tau$.

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group, see the note on " $D^0 - \bar{D}^0$ Mixing."

¹ AAIJ 19x D^0 come from D^{*+} and $\bar{B} \rightarrow D^0 \mu^- X$ decays (and c.c.) in pp collisions at 7 and 8 TeV. Measurement allows for CP violation (none seen).

² The result was established with D^0 from prompt and secondary D^* . Based on 5 fb⁻¹ of data collected at $\sqrt{s} = 7, 8, 13$ TeV. Assumes no CP violation. Reported $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$ and $y' = (5.28 \pm 0.52) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y$.

³ Model-independent measurement of the charm mixing parameters in the decay $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ using 1.0 fb⁻¹ of LHCB data at $\sqrt{s} = 7$ TeV.

⁴ Time-dependent amplitude analysis of $D^0 \rightarrow \pi^+ \pi^- \pi^0$.

⁵ Based on 976 fb⁻¹ of data collected at Y(nS) resonances. Assumes no CP violation. Reported $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$ and $y' = (4.6 \pm 3.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.

⁶ The time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation and is sensitive to the sign of Δm .

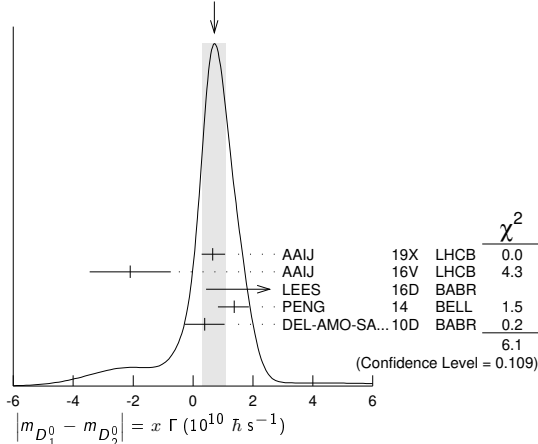

See key on page 999

Meson Particle Listings

D^0

- ⁷Based on 9.6 fb^{-1} of data collected at the Tevatron. Assumes no CP violation. Reported $\chi^2 = (0.08 \pm 0.18) \times 10^{-3}$ and $y' = (4.3 \pm 4.3) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ⁸DEL-AMO-SANCHEZ 10D uses $540,800 \pm 800 K_S^0 \pi^+ \pi^-$ and $79,900 \pm 300 K_S^0 K^+ K^-$ events in a time-dependent amplitude analysis of the D^0 and \bar{D}^0 Dalitz plots. No evidence was found for CP violation, and the values here assume no such violation.
- ⁹The result was established with D^0 from prompt and secondary D^* . Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Assumes no CP violation. Reported $\chi^2 = (3.6 \pm 4.3) \times 10^{-5}$ and $y' = (5.23 \pm 0.84) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹⁰Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Assumes no CP violation. Reported $\chi^2 = (5.5 \pm 4.9) \times 10^{-4}$ and $y' = (4.8 \pm 1.0) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹¹Based on 1 fb^{-1} of data collected at $\sqrt{s} = 7 \text{ TeV}$ in 2011. Assumes no CP violation. Reported $\chi^2 = (-0.9 \pm 1.3) \times 10^{-4}$ and $y' = (7.2 \pm 2.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹²The AUBERT 09AN values are inferred from the branching ratio $\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0) / \Gamma(D^0 \rightarrow K^+ \pi^- \pi^0)$ given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between $D^0 \rightarrow K^+ \pi^- \pi^0$ and $\bar{D}^0 \rightarrow K^+ \pi^- \pi^0$ is assumed to be small. The width difference here is y'' , which is not the same as y_{CP} in the note on D^0 - \bar{D}^0 mixing.
- ¹³LOWREY 09 uses quantum correlations in $e^+ e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$. See below for coherence factors and average relative strong phases for both $D^0 \rightarrow K^+ \pi^- \pi^0$ and $D^0 \rightarrow K^+ \pi^- 2\pi^+$. A fit that includes external measurements of charm mixing parameters gets $\Delta m = (2.34 \pm 0.61) \times 10^{10} \text{ h s}^{-1}$.
- ¹⁴The ASNER 05 and ZHANG 07b values are from the time-dependent Dalitz plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation and is sensitive to the sign of Δm .
- ¹⁵The AUBERT 03Z, LI 05A, and ZHANG 06 limits are inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^- \text{ (via } \bar{D}^0)) / \Gamma(K^+ \pi^- \text{ (via } D^0))$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from D^0 - \bar{D}^0 mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. AUBERT 03Z assumes the strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ amplitudes is small; if an arbitrary phase is allowed, the limit degrades by 20%. The LI 05A and ZHANG 06 limits are valid for an arbitrary strong phase.
- ¹⁶This LINK 05H limit is inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^- \text{ (via } \bar{D}^0)) / \Gamma(K^+ \pi^- \text{ (via } D^0))$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from D^0 - \bar{D}^0 mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by 25%.
- ¹⁷This GODANG 00 limit is inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^- \text{ (via } \bar{D}^0)) / \Gamma(K^+ \pi^- \text{ (via } D^0))$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from D^0 - \bar{D}^0 mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by a factor of two.
- ¹⁸AITALA 98 allows interference between the doubly Cabibbo-suppressed and mixing amplitudes, and also allows CP violation in this term, but assumes that $A_D = A_R = 0$. See the note on " D^0 - \bar{D}^0 Mixing," above.
- ¹⁹This limit is inferred from R_M for $f = K^+ \pi^-$ and $f = K^+ \pi^- \pi^+ \pi^-$. See the note on " D^0 - \bar{D}^0 Mixing," above. Decay-time information is used to distinguish doubly Cabibbo-suppressed decays from D^0 - \bar{D}^0 mixing.
- ²⁰This limit is inferred from R_M for $f = K^+ \ell^- \bar{\nu}_\ell$. See the note on " D^0 - \bar{D}^0 Mixing," above.
- ²¹ANJOS 88c assumes that $y = 0$. See the note on " D^0 - \bar{D}^0 Mixing," above. Without this assumption, the limit degrades by about a factor of two.

WEIGHTED AVERAGE
 0.7 ± 0.4 (Error scaled by 1.4)

$$(\Gamma_{D_1^0} - \Gamma_{D_2^0}) / \Gamma = 2y$$

The D_1^0 and D_2^0 are the mass eigenstates of the D^0 meson, as described in the note on " D^0 - \bar{D}^0 Mixing," above.

Due to the strong phase difference between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$, we exclude from the average those measurements of y' that are inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^- \text{ via } \bar{D}^0) / \Gamma(K^+ \pi^-)$ given near the end of this D^0 Listings.

Some early results have been omitted. See our 2006 Review (Journal of Physics **G33** 1 (2006)).

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group, see the note on " D^0 - \bar{D}^0 Mixing."

- ¹Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Measures the lifetime difference between $D^0 \rightarrow K^- K^+$ and $D^0 \rightarrow \pi^- \pi^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = (\Gamma_{CP+} - \Gamma_{CP-}) / (\Gamma_{CP+} + \Gamma_{CP-})$. The D^0 mesons are required to originate from semimuonic decays of B mesons. We list $2y_{CP} = \Delta \Gamma / \Gamma$.
- ²AAIJ 19X D^0 come from D^{*+} and $\bar{B}^0 \rightarrow D^0 \mu^- X$ decays (and c.c.) in pp collisions at 7 and 8 TeV. Measurement allows for CP violation (none seen).
- ³The result was established with D^0 from prompt and secondary D^* . Based on 5 fb^{-1} of data collected at $\sqrt{s} = 7, 8, 13 \text{ TeV}$. Assumes no CP violation. Reported $\chi^2 = (3.9 \pm 2.7) \times 10^{-5}$ and $y' = (5.28 \pm 0.52) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ⁴Model-independent measurement of the charm mixing parameters in the decay $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ using 1.0 fb^{-1} of LHCb data at $\sqrt{s} = 7 \text{ TeV}$.
- ⁵Time-dependent amplitude analysis of $D^0 \rightarrow \pi^+ \pi^- \pi^0$.
- ⁶An improved measurement of $\bar{D}^0 - D^0$ mixing and a search for CP violation in D^0 decays to CP -even final states $K^+ K^-$ and $\pi^+ \pi^-$ using the final Belle data sample of 976 fb^{-1} .
- ⁷ABLIKIM 15D uses quantum correlations in $e^+ e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$.
- ⁸Based on 976 fb^{-1} of data collected at $Y(1S)$ resonances. Assumes no CP violation. Reported $\chi^2 = (0.09 \pm 0.22) \times 10^{-3}$ and $y' = (4.6 \pm 3.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.

Meson Particle Listings

 D^0

- ⁹The time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation and is sensitive to the sign of Δm .
- ¹⁰Based on 9.6 fb^{-1} of data collected at the Tevatron. Assumes no CP violation. Reported $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$ and $y' = (4.3 \pm 4.3) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹¹Obtained $y_{CP} = (0.72 \pm 0.18 \pm 0.12)\%$ based on three effective D^0 lifetimes measured in $K^+ \pi^-$, $K^- K^+$, and $\pi^- \pi^+$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- ¹²Compared the lifetimes of D^0 decay to the CP eigenstate $K^+ K^-$ with D^0 decay to $\pi^+ \pi^-$. The values here assume no CP violation.
- ¹³DEL-AMO-SANCHEZ 10b uses $540,800 \pm 800 K_S^0 \pi^+ \pi^-$ and $79,900 \pm 300 K_S^0 K^+ K^-$ events in a time-dependent amplitude analyses of the D^0 and \bar{D}^0 Dalitz plots. No evidence was found for CP violation, and the values here assume no such violation.
- ¹⁴ZUPANC 09 uses a method based on measuring the mean decay time of $D^0 \rightarrow K_S^0 K^+ K^-$ events for different $K^+ K^-$ mass intervals.
- ¹⁵LINK 00, AITALA 99E, and ABE 02i measure the lifetime difference between $D^0 \rightarrow K^- K^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)] / [\Gamma(CP+) + \Gamma(CP-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- ¹⁶CSORNA 02 measures the lifetime difference between $D^0 \rightarrow K^- K^+$ and $\pi^- \pi^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)] / [\Gamma(CP+) + \Gamma(CP-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- ¹⁷The result was established with D^0 from prompt and secondary D^* . Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Assumes no CP violation. Reported $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$ and $y' = (5.23 \pm 0.84) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹⁸Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Assumes no CP violation. Reported $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$ and $y' = (4.8 \pm 1.0) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹⁹Based on 1 fb^{-1} of data collected at $\sqrt{s} = 7 \text{ TeV}$ in 2011. Assumes no CP violation. Reported $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$ and $y' = (7.2 \pm 2.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ²⁰This combines the $y_{CP} = (\tau_{K\pi}/\tau_{KK}) - 1$ using untagged $K^- \pi^+$ and $K^- K^+$ events of AUBERT 09A1 with the disjoint y_{CP} using tagged $K^- \pi^+$, $K^- K^+$, and $\pi^- \pi^+$ events of AUBERT 08U.
- ²¹The AUBERT 09AN values are inferred from the branching ratio $\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0)$ via $\bar{D}^0/\Gamma(D^0 \rightarrow K^- \pi^+ \pi^0)$ given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between $D^0 \rightarrow K^+ \pi^- \pi^0$ and $\bar{D}^0 \rightarrow K^+ \pi^- \pi^0$ is assumed to be small. The width difference here is y'' , which is not the same as y_{CP} in the note on D^0 - \bar{D}^0 mixing.
- ²²LOWREY 09 uses quantum correlations in $e^+ e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$. See below for coherence factors and average relative strong phases for both $D^0 \rightarrow K^- \pi^+ \pi^0$ and $D^0 \rightarrow K^- \pi^- 2\pi^+$. A fit that includes external measurements of charm mixing parameters gets $2y = (1.62 \pm 0.32) \times 10^{-2}$.
- ²³The GODANG 00, AUBERT 03Z, LINK 05H, LI 05A, ZHANG 06, AUBERT 07W, and AALTONEN 08E limits are inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^-)$ (via $\bar{D}^0)/\Gamma(K^- \pi^+)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from D^0 - \bar{D}^0 mixing. The limits allow interference between the DCS and mixing ratios, and all except AUBERT 07W and AALTONEN 08E also allow CP violation. The phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ is assumed to be small. This is a measurement of y' and is not the same as the y_{CP} of our note above on " D^0 - \bar{D}^0 Mixing."
- ²⁴This value combines the results of AUBERT 08U and AUBERT 03P.
- ²⁵STARIC 07 compares the lifetimes of D^0 decay to the CP eigenstates $K^+ K^-$ and $\pi^+ \pi^-$ with D^0 decay to $K^- \pi^+$.
- ²⁶The ASNER 05 and ZHANG 07B values are from the time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This limit allows CP violation.
- ²⁷The ranges of AUBERT 03Z, LINK 05H, LI 05A, and ZHANG 06 measurements are for 95% confidence level.
- ²⁸AUBERT 03P measures $Y \equiv 2\tau^0 / (\tau^+ + \tau^-) - 1$, where τ^0 is the $D^0 \rightarrow K^- \pi^+$ (and $\bar{D}^0 \rightarrow K^+ \pi^-$) lifetime, and τ^+ and τ^- are the D^0 and \bar{D}^0 lifetimes to CP -even states (here $K^- K^+$ and $\pi^- \pi^+$). In the limit of CP conservation, $Y = y \equiv \Delta\Gamma / 2\Gamma$ (we list $2y = \Delta\Gamma/\Gamma$). AUBERT 03P also uses $\tau^+ - \tau^-$ to get $\Delta Y = -0.008 \pm 0.006 \pm 0.002$.

 $|q/p|$

The mass eigenstates D_1^0 and D_2^0 are related to the $C = \pm 1$ states by $|D_{1,2}^0\rangle = p|D^0\rangle + q|\bar{D}^0\rangle$. See the note on " D^0 - \bar{D}^0 Mixing" above.

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group. This would include as-yet-unpublished results, see the note on " D^0 - \bar{D}^0 Mixing."

- ¹AAIJ 19X D^0 come from D^{*+} and $\bar{B} \rightarrow D^0 \mu^- X$ decays (and c.c.) in pp collisions at 7 and 8 TeV.
- ²Based on 5 fb^{-1} of data collected at $\sqrt{s} = 7, 8, 13 \text{ TeV}$. Allowing for CP violation, the direct CP violation in mixing is reported $1.00 < |q/p| < 1.35$ at the 68.3% CL for the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ³The time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation and is sensitive to the sign of Δm .
- ⁴Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Allowing for CP violation, the direct CP violation in mixing is reported $0.75 < |q/p| < 1.24$ at the 68.3% CL for the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ⁵The phase of p/q is $(-14^{+16}_{-18} \pm 5)^\circ$. The ZHANG 07B value is from the time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation.

 A_Γ

A_Γ is the decay-rate asymmetry for CP -even final states $A_\Gamma = (\bar{\tau}_+ - \tau_+) / (\bar{\tau}_+ + \tau_+)$. See the note on " D^0 - \bar{D}^0 Mixing" above.

- ⁸Measured using $D^0 \rightarrow \pi^+ \pi^-$ decays, with D^0 from partially reconstructed semileptonic B hadron decays.

 $\phi_{K_S^0 \pi^+ \pi^-}$

Parametrizes CP violation in the interference between D^0 mixing and decay. The mass eigenstates D_1^0 and D_2^0 are related to the $C = \pm 1$ states by $|D_{1,2}^0\rangle = p|D^0\rangle + q|\bar{D}^0\rangle$. In the absence of CP violation in the decay, and using the usual phase convention where CP conservation implies q/p is real, $\phi_{K_S^0 \pi^+ \pi^-}$ is identical to the decay-mode-independent parameter $\phi = \arg(q/p)$.

1.03 ± 0.31 -0.17 ± 0.06	³ ASNER	08	CLEO Repl. by ASNER 12

¹ Uses quantum correlations in $e^+e^- \rightarrow D^0\bar{D}^0$ at the $\psi(3770)$ to measure the asymmetry of the branching fraction of $D^0 \rightarrow K^-\pi^+$ in CP -odd and CP -even eigenstates to be $(12.7 \pm 1.3 \pm 0.7)\%$. A fit that includes external measurements of charm mixing parameters finds the value quoted above.

² Uses quantum correlations in $e^+e^- \rightarrow D^0\bar{D}^0$ at the $\psi(3770)$, where decay rates of CP -tagged $K\pi$ final states depend on the strong phases between the decays of $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$. The measurements obtained $\sin(\delta) = -0.01 \pm 0.41 \pm 0.04$ and $|\delta| = (10^{+28+13}_{-53-00})^\circ$ as well. A fit that includes external measurements of charm mixing parameters finds $\cos(\delta) = 1.15^{+0.19+0.00}_{-0.17-0.08}$, $\sin(\delta) = 0.56^{+0.32+0.21}_{-0.31-0.20}$, and $|\delta| = (18^{+11}_{-17})^\circ$.

³ ASNER 08 uses quantum correlations in $e^+e^- \rightarrow D^0\bar{D}^0$ at the $\psi(3770)$, where decay rates of CP -tagged $K\pi$ final states depend on $\cos \delta$ because of interfering amplitudes. The above measurement implies $|\delta| < 75^\circ$ with a confidence level of 95%. A fit that includes external measurements of charm mixing parameters finds $\cos \delta = 1.10 \pm 0.35 \pm 0.07$. See also the note on " D^0 - \bar{D}^0 Mixing" p. 783 in our 2008 Review (PDG 08).

 $D^0 \rightarrow K^-\pi^+\pi^0$ COHERENCE FACTOR $R_{K\pi\pi^0}$

See the note on ' D^0 - \bar{D}^0 Mixing' for the definition. $R_{K\pi\pi^0}$ can have any value between 0 and 1. A value near 1 indicates the decay is dominated by a few intermediate states with limited interference.

 D^0 DECAY MODES

Most decay modes (other than the semileptonic modes) that involve a neutral K meson are now given as K_S^0 modes, not as \bar{K}^0 modes. Nearly always it is a K_S^0 that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K_S^0) = \Gamma(\bar{K}^0)$.

[a] This value is obtained by subtracting the branching fractions for 2-, 4- and 6-prongs from unity.

[b] This is the sum of our $K^- 2\pi^+ \pi^-$, $K^- 2\pi^+ \pi^- \pi^0$, $\bar{K}^0 2\pi^+ 2\pi^-$, $K^+ 2K^- \pi^+$, $2\pi^+ 2\pi^-$, $2\pi^+ 2\pi^- \pi^0$, $K^+ K^- \pi^+ \pi^-$, and $K^+ K^- \pi^+ \pi^- \pi^0$, branching fractions.

Meson Particle Listings

D^0

$\Gamma(4\text{-prongs})/\Gamma_{\text{total}}$ Γ_3/Γ
 This is the sum of our $K^-2\pi^+\pi^-$, $K^-2\pi^+\pi^-\pi^0$, $\bar{K}^02\pi^+2\pi^-$, $K^+2K^-\pi^+$, $2\pi^+2\pi^-$, $2\pi^+2\pi^-\pi^0$, $K^+K^-\pi^+\pi^-$, and $K^+K^-\pi^+\pi^-\pi^0$ branching fractions.

4.1 ± 0.6	0.3k	⁹ SCHINDLER	81 MRK2 e^+e^- 3.771 GeV
4.3 ± 1.0	130	¹⁰ PERUZZI	77 LGW e^+e^- 3.77 GeV

¹ ABLIKIM 18w measured the combined $K^{\mp} \pi^{\pm}$ branching fraction to be 3.898%. We have subtracted off the doubly Cabibbo-suppressed branching fraction $B(D^0 \rightarrow K^+ \pi^-) = (1.50 \pm 0.07) \times 10^{-4}$, even though it is less than one-third of the uncertainty of the combined measurement, in order to treat this as a measurement of $B(D^0 \rightarrow K^- \pi^+)$.

² This combines the CLEO results of ARTUSO 98, COAN 98, and AKERIB 93.

³ ABACHI 88, DECAMP 91J, AKERIB 93, ALBRECHT 94f, and BARATE 97c use $D^*(2010)^+ \rightarrow D^0 \pi^+$ decays. The π^+ is both slow and of low p_T with respect to the event thrust axis or nearest jet ($\approx D^{*+}$ direction). The excess number of such π^+ 's over background gives the number of $D^*(2010)^+ \rightarrow D^0 \pi^+$ events, and the fraction with $D^0 \rightarrow K^- \pi^+$ gives the $D^0 \rightarrow K^- \pi^+$ branching fraction.

⁴ DOBBS 07 and HE 05 use single- and double-tagged events in an overall fit. DOBBS 07 supersedes HE 05.

⁵ ARTUSO 98, following ALBRECHT 94, uses D^0 mesons from $\bar{B}^0 \rightarrow D^*(2010)^+ X \ell^- \bar{\nu}_\ell$ decays. Our average uses the CLEO average of this value with the values of COAN 98 and AKERIB 93.

⁶ COAN 98 assumes that $\Gamma(B \rightarrow \bar{D} X \ell^+ \nu)/\Gamma(B \rightarrow X \ell^+ \nu) = 1.0 - 3|V_{ub}/V_{cb}|^2 - 0.010 \pm 0.005$, the last term accounting for $\bar{B} \rightarrow D_s^+ K X \ell^- \bar{\nu}$. COAN 98 is included in the CLEO average in ARTUSO 98.

⁷ ALBRECHT 94 uses D^0 mesons from $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}_\ell$ decays. This is a different set of events than used by ALBRECHT 94f.

⁸ This AKERIB 93 value includes radiative corrections; without them, the value is $0.0391 \pm 0.0008 \pm 0.0017$. AKERIB 93 is included in the CLEO average in ARTUSO 98.

⁹ SCHINDLER 81 (MARK-2) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.24 ± 0.02 nb. We use the MARK-3 (ADLER 88c) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

¹⁰ PERUZZI 77 (MARK-1) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.25 ± 0.05 nb. We use the MARK-3 (ADLER 88c) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

6.2 ± 1.9	44	5 PERUZZI	77	LGW e^+e^- 3.77 GeV

¹ DOBBS 07 and HE 05 use single- and double-tagged events in an overall fit. DOBBS 07 supersedes HE 05.

² ALBRECHT 94 uses D^0 mesons from $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}_\ell$ decays. This is a different set of events than used by ALBRECHT 94F.

³ See the footnote on the ALBRECHT 94F measurement of $\Gamma(K^-\pi^+)/\Gamma_{\text{total}}$ for the method used.

⁴ SCHINDLER 81 (MARK-2) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.68 ± 0.11 nb. We use the MARK-3 (ADLER 88C) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

⁵ PERUZZI 77 (MARK-1) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.36 ± 0.10 nb. We use the MARK-3 (ADLER 88C) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

 $\Gamma(K_S^0 \pi^+ \pi^- \pi^0)/\Gamma(K_S^0 \pi^+ \pi^-)$ Γ_{81}/Γ_{38}

Branching fractions for submodes of this mode with narrow resonances (the η, ω, η') are fairly well determined (see below). COFFMAN 92B gives fractions of K^* and ρ submodes, but with only 140 ± 28 events above background could not determine them with much accuracy. We omit those measurements here; they are in our 2008 Review (Physics Letters **B667** 1 (2008)).

¹ ARTUSO 12 and DARGENT 17 use the same dataset, but ARTUSO 12 uses a formulation for the D-wave component that is in fact a mix of S- and D-wave, while DARGENT 17 uses a pure D-wave. This explains the discrepancy in their $\rho\phi$ S- and D-wave components.

< 50 × 10⁻⁴ 90 ² AITALA 96c E791 π^- nucleus, 500 GeV

¹ The BITENC 08 right-sign sample includes about 15% of $D^0 \rightarrow K^- \pi^0 \ell^+ \nu_\ell$ and other decays.

² AITALA 96c uses $D^{*+} \rightarrow D^0 \pi^+$ (and charge conjugate) decays to identify the charm at production and $D^0 \rightarrow K^- \ell^+ \nu_\ell$ (and charge conjugate) decays to identify the charm at decay.

$\Gamma(K^+ \alpha K^*(892)^+ e^- \nu_\ell \text{ via } \bar{D}^0) / [\Gamma(K^- e^+ \nu_\ell) + \Gamma(K^*(892)^- e^+ \nu_\ell)]$ $\Gamma_{255} / (\Gamma_{19} + \Gamma_{21})$

This is a limit on R_M without the complications of possible doubly Cabibbo-suppressed decays that occur when using hadronic modes. The experiments use $D^{*+} \rightarrow D^0 \pi^+$ (and charge conjugate) decays to identify the charm at production and the charge of the e to identify the charm at decay. These limits do not allow CP violation. For the limits on $|m_1 - m_2|$ and $(\Gamma_1 - \Gamma_2) / \Gamma$ that come from the best mixing limit, see near the beginning of these D^0 Listings.

$\Gamma(K^+ \pi^-) / \Gamma(K^- \pi^+)$ $\Gamma_{256} / \Gamma_{35}$

This is R , the time-integrated wrong-sign rate compared to the right-sign rate. See the note on " D^0 - \bar{D}^0 Mixing," near the start of the D^0 Listings.

The experiments here use the charge of the pion in $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$ decay to tell whether a D^0 or a \bar{D}^0 was born. The $D^0 \rightarrow K^+ \pi^-$ decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by $D^0 \rightarrow \bar{D}^0$ mixing followed by $\bar{D}^0 \rightarrow K^+ \pi^-$ decay. Some of the experiments can use the decay-time information to disentangle the two mechanisms. Here, we list the experimental branching ratio, which if there is no mixing is the DCS ratio. See the next data block for values of the DCS ratio R_D , and the following data block for limits on the mixing ratio R_M . See the section on CP -violating asymmetries near the end of this D^0 Listing for values of A_D , and the note on " D^0 - \bar{D}^0 Mixing" for limits on x' and y' .

Some early limits have been omitted from this Listing; see our 1998 edition (The European Physical Journal **C3** 1 (1998)) and our 2006 edition (Journal of Physics **G33** 1 (2006)).

$\Gamma(K^+\pi^+2\pi^- \text{ via DCS})/\Gamma(K^-2\pi^+\pi^-)$ Γ_{265}/Γ_{70}

VALUE (units 10 ⁻³)	EVTS	DOCUMENT ID	TECN	COMMENT
3.03 ± 0.07 OUR AVERAGE				
3.025 ± 0.077	42k,11M	¹ AAIJ	16F LHCb	pp at 7, 8 TeV
3.03 ± 0.13		² EVANS	16 CLEO	e ⁺ e ⁻ → D ⁰ \bar{D}^0 at $\psi(3770)$

¹This result uses external input on the mixing parameters x, y. Without this input, the result is (3.215 ± 0.136) × 10⁻³.
²A combined fit with a recent LHCb D⁰ \bar{D}^0 mixing results in AAJ 16F is also reported to be (3.01 ± 0.07) × 10⁻³.

$\Gamma(K^+\pi^+2\pi^-)/\Gamma(K^-2\pi^+\pi^-)$ Γ_{266}/Γ_{70}

The experiments here use the charge of the pion in D*(2010)[±] → (D⁰ or \bar{D}^0) π[±] decay to tell whether a D⁰ or a \bar{D}^0 was born. The D⁰ → K⁺π⁻π⁺π⁻ decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by D⁰ → \bar{D}^0 mixing followed by \bar{D}^0 → K⁺π⁻π⁺π⁻ decay. Some of the experiments can use the decay-time information to disentangle the two mechanisms. Here, we list the experimental branching ratio, which if there is no mixing is the DCS ratio; in the next data block we give the limits on the mixing ratio.

Some early limits have been omitted from this Listing; see our 1998 edition (EPJ C3 1).

-8.0 ± 7.7	0.8k	⁷ LI	05A	BELL See ZHANG 06

¹ Based on 3 fb⁻¹ of data collected at $\sqrt{s} = 7, 8$ TeV. Allowing for CP violation, the direct CP-violation in mixing is reported for the $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^-\pi^+$.

² The CPV is derived from $A_{CP} = (R_D^+ - R_D^-)/(R_D^+ + R_D^-)$.

³ This ZHANG 06 result allows mixing.

⁴ This LINK 05H result assumes no mixing. If mixing is allowed, it becomes $0.13^{+0.33}_{-0.25} \pm 0.10$.

⁵ This AUBERT 03Z limit assumes no mixing. If mixing is allowed, the 95% confidence-level interval is $(-2.8 < A_D < 4.9) \times 10^{-3}$.

⁶ This GODANG 00 result assumes no $D^0 - \bar{D}^0$ mixing and becomes $-0.43 < A_{CP} < +0.34$ at 95% CL. If mixing is allowed $A_{CP} = -0.01 \pm 0.16 \pm 0.01$.

⁷ This LI 05A result allows mixing.

¹ Obtained by analyzing CLEO data but not authored by the CLEO Collaboration. D^0 CP-VIOLATING ASYMMETRY DIFFERENCES $\Delta A_{CP} = A_{CP}(K^+ K^-) - A_{CP}(\pi^+ \pi^-)$ CP violation in these modes can come from the decay amplitudes (direct) and/or from mixing or interference of mixing and decay (indirect). The difference ΔA_{CP} is primarily sensitive to the direct component, and only retains a second-order dependence on the indirect component for measurements where the mean decay time of the $K^+ K^-$ and $\pi^+ \pi^-$ samples are not identical. The results below are averaged assuming the indirect component can be neglected.

D^0

D^0 TESTS OF LOCAL CP -VIOLATION (CPV)

We list model-independent searches for local CP violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a χ^2 test comparing normalised yields N_i, \bar{N}_i in CP -conjugate bin pairs i : $\chi^2 = \sum_i (N_i - \alpha \bar{N}_i) / \sigma(N_i - \alpha \bar{N}_i)$. The factor $\alpha = (\sum_i N_i) / (\sum_i \bar{N}_i)$ removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured χ^2 or larger under the assumption of CP conservation [AUBERT 08AO, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14c]. Results can be combined using Fisher's method [MOSTELLER 48].

CP VIOLATING ASYMMETRIES OF P -ODD (T -ODD) MOMENTS

The CP -sensitive P -odd (T -odd) correlation in D^0, \bar{D}^0 decays. The D^0 and \bar{D}^0 are distinguished by the charge of the parent D^* : $D^{*+} \rightarrow D^0 \pi^+$ and $D^{*-} \rightarrow \bar{D}^0 \pi^-$.

$A_{Tviol}(K^+ K^- \pi^+ \pi^-)$ in $D^0, \bar{D}^0 \rightarrow K^+ K^- \pi^+ \pi^-$

$C_T \equiv \vec{p}_{K^+} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$ is a parity-odd correlation of the $K^+, \pi^+,$ and π^- momenta (evaluated in the D^0 rest frame) for the D^0 . $\bar{C}_T \equiv \vec{p}_{K^-} \cdot (\vec{p}_{\pi^-} \times \vec{p}_{\pi^+})$ is the corresponding quantity for the \bar{D}^0 . Then $A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$, and $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$, and $A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$. C_T and \bar{C}_T are commonly referred to as T -odd moments, because they are odd under T reversal. However, the T -conjugate process $K^+ K^- \pi^+ \pi^- \rightarrow D^0$ is not accessible, while the P -conjugate process is.

¹ PRASANTH 17 also measures A_{Tviol} in sub-regions of the $D^0 \rightarrow K_S \pi^+ \pi^- \pi^0$ phase-space. No evidence of T violation is found.

D^0 CPT -VIOLATING DECAY-RATE ASYMMETRIES

$A_{CPT}(K^{\mp} \pi^{\pm})$ in $D^0 \rightarrow K^- \pi^+, \bar{D}^0 \rightarrow K^+ \pi^-$

$A_{CPT}(t)$ is defined in terms of the time-dependent decay probabilities $P(D^0 \rightarrow K^- \pi^+)$ and $\bar{P}(\bar{D}^0 \rightarrow K^+ \pi^-)$ by $A_{CPT}(t) = (P - \bar{P}) / (P + \bar{P})$. For small mixing parameters $x \equiv \Delta m / \Gamma$ and $y \equiv \Delta \Gamma / 2\Gamma$ (as is the case), and times t , $A_{CPT}(t)$ reduces to $[y \text{Re } \xi - x \text{Im } \xi] \Gamma t$, where ξ is the CPT -violating parameter.

The following is actually $y \text{Re } \xi - x \text{Im } \xi$.

 $D^*(2007)^0$ DECAY MODES

$\bar{D}^*(2007)^0$ modes are charge conjugates of modes below.

Mode	Fraction (Γ_i/Γ)
Γ_1 $D^0\pi^0$	(64.7 ± 0.9) %
Γ_2 $D^0\gamma$	(35.3 ± 0.9) %

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 5 measurements and one constraint to determine 2 parameters. The overall fit has a $\chi^2 = 2.5$ for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.
