

$$I(J^P) = \frac{1}{2}(0^-)$$

## $K_S^0$ MEAN LIFE

For earlier measurements, beginning with BOLDT 58B, see our 1986 edition, Physics Letters **170B** 130 (1986).

OUR FIT is described in the note on "CP violation in  $K_L$  decays" in the  $K_L^0$  Particle Listings. The result labeled "OUR FIT Assuming CPT" ["OUR FIT Not assuming CPT"] includes all measurements except those with the comment "Not assuming CPT" ["Assuming CPT"]. Measurements with neither comment do not assume CPT and enter both fits.

VALUE ( $10^{-10}$ s)	EVTS	DOCUMENT ID	TECN	COMMENT
<b>0.8954 ± 0.0004 OUR FIT</b>		Error includes scale factor of 1.1. Assuming CPT

0.872 ± 0.009	20000	<sup>9,10</sup> HILL	68	DBC

<sup>1</sup> The two ABOUZAID 11 values use the same full KTeV dataset from 1996, 1997, and 1999. The first enters the "assuming CPT" fit and the second enters the "not assuming CPT" fit.

<sup>2</sup> ABOUZAID 11 fit has  $\Delta m$ ,  $\tau_s$ ,  $\phi_\epsilon$ ,  $\text{Re}(\epsilon'/\epsilon)$ , and  $\text{Im}(\epsilon'/\epsilon)$  as free parameters. See  $\text{Im}(\epsilon'/\epsilon)$  in the " $K_L^0$  CP violation" section for correlation information.

<sup>3</sup> ABOUZAID 11 fit has  $\Delta m$  and  $\tau_s$  free but constrains  $\phi_\epsilon$  to the Superweak value, i.e. assumes CPT. This  $\tau_s$  value is correlated with their  $\Delta m = m_{K_L^0} - m_{K_S^0}$  measurement in the  $K_L^0$  listings. The correlation coefficient  $\rho(\tau_s, \Delta m) = -0.670$ .

<sup>4</sup> Fit to the proper time distribution.

<sup>5</sup> This ALAVI-HARATI 03 fit has  $\Delta m$  and  $\tau_s$  free but constrains  $\phi_{+-}$  to the Superweak value, i.e. assumes CPT. This  $\tau_s$  value is correlated with their  $\Delta m = m_{K_L^0} - m_{K_S^0}$  measurement in the  $K_L^0$  listings. The correlation coefficient  $\rho(\tau_s, \Delta m) = -0.396$ . Superseded by ABOUZAID 11.

- <sup>6</sup>This ALAVI-HARATI 03 fit has  $\Delta m$ ,  $\phi_{+-}$ , and  $\tau_{K_S}$  free. See  $\phi_{+-}$  in the “ $K_L$  CP violation” section for correlation information. Superseded by ABOUZAID 11.
- <sup>7</sup>ARONSON 82 find that  $K_S^0$  mean life may depend on the kaon energy.
- <sup>8</sup>CARITHERS 75 measures the  $\Delta m$  dependence of the total decay rate (inverse mean life) to be  $\Gamma(K_S^0) = [(1.122 \pm 0.004) + 0.16(\Delta m - 0.5348)/\Delta m] 10^{10} / \text{s}$ , or, in terms of mean life, CARITHERS 75 measures  $\tau_s = (0.8913 \pm 0.0032) - 0.238 [\Delta m - 0.5348] (10^{-10} \text{ s})$ . We have adjusted the measurement to use our best values of ( $\Delta m = 0.5293 \pm 0.0009$ ) ( $10^{10} \text{ h s}^{-1}$ ). Our first error is their experiment's error and our second error is the systematic error from using our best values.
- <sup>9</sup>HILL 68 has been changed by the authors from the published value ( $0.865 \pm 0.009$ ) because of a correction in the shift due to  $\eta_{+-}$ . SKJEGGESTAD 72 and HILL 68 give detailed discussions of systematics encountered in this type of experiment.
- <sup>10</sup>Pre-1971 experiments are excluded from the average because of disagreement with later more precise experiments.

## $K_S^0$ DECAY MODES

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level
<b>Hadronic modes</b>		
$\Gamma_1$ $\pi^0 \pi^0$	( $30.69 \pm 0.05$ ) %	
$\Gamma_2$ $\pi^+ \pi^-$	( $69.20 \pm 0.05$ ) %	
$\Gamma_3$ $\pi^+ \pi^- \pi^0$	( $3.5 \begin{array}{l} +1.1 \\ -0.9 \end{array} \right) \times 10^{-7}$	
<b>Modes with photons or <math>\ell\bar{\ell}</math> pairs</b>		
$\Gamma_4$ $\pi^+ \pi^- \gamma$	[ $a,b$ ] ( $1.79 \pm 0.05$ ) $\times 10^{-3}$	
$\Gamma_5$ $\pi^+ \pi^- e^+ e^-$	( $4.79 \pm 0.15$ ) $\times 10^{-5}$	
$\Gamma_6$ $\pi^0 \gamma \gamma$	[ $a$ ] ( $4.9 \pm 1.8$ ) $\times 10^{-8}$	
$\Gamma_7$ $\gamma \gamma$	( $2.63 \pm 0.17$ ) $\times 10^{-6}$	S=3.1
$\Gamma_8$ $\mu^+ \mu^- \mu^+ \mu^-$	< 5.1 $\times 10^{-12}$	CL=90%
<b>Semileptonic modes</b>		
$\Gamma_9$ $\pi^\pm e^\mp \nu_e$	[ $c$ ] ( $7.14 \pm 0.06$ ) $\times 10^{-4}$	
$\Gamma_{10}$ $\pi^\pm \mu^\mp \nu_\mu$	[ $c,d$ ] ( $4.56 \pm 0.20$ ) $\times 10^{-4}$	
<b>CP violating (CP) and <math>\Delta S = 1</math> weak neutral current (S1) modes</b>		
$\Gamma_{11}$ $3\pi^0$	CP < 2.6 $\times 10^{-8}$	CL=90%
$\Gamma_{12}$ $\mu^+ \mu^-$	S1 < 2.1 $\times 10^{-10}$	CL=90%
$\Gamma_{13}$ $e^+ e^-$	S1 < 9 $\times 10^{-9}$	CL=90%
$\Gamma_{14}$ $\pi^0 e^+ e^-$	S1 [ $a$ ] ( $3.0 \begin{array}{l} +1.5 \\ -1.2 \end{array} \right) \times 10^{-9}$	
$\Gamma_{15}$ $\pi^0 \mu^+ \mu^-$	S1 ( $2.9 \begin{array}{l} +1.5 \\ -1.2 \end{array} \right) \times 10^{-9}$	

[a] See the Particle Listings below for the energy limits used in this measurement.

- [b] Most of this radiative mode, the low-momentum  $\gamma$  part, is also included in the parent mode listed without  $\gamma$ 's.
- [c] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [d] Not a measurement. Calculated as  $0.666 \cdot B(\pi^\pm e^\mp \nu_e)$ .

## CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 5 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 0.6$  for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$x_2$	-100			
$x_9$	-9	8		
$x_{10}$	-1	-3	0	
	$x_1$	$x_2$	$x_9$

<b>3.5<sup>+1.1</sup><sub>-0.9</sub> OUR AVERAGE</b>				

4.7 <sup>+2.2+1.7</sup> <sub>-1.7-1.5</sub>		<sup>1</sup> BATLEY	05	NA48
---	--	---------------------	----	------

$2.5^{+1.3+0.5}_{-1.0-0.6}$	500k	<sup>2</sup> ADLER	97B	CPLR
$4.8^{+2.2}_{-1.6} \pm 1.1$		<sup>3</sup> ZOU	96	E621
<b>• • • We do not use the following data for averages, fits, limits, etc. • • •</b>				
$4.1^{+2.5+0.5}_{-1.9-0.6}$		<sup>4</sup> ADLER	96E	CPLR Sup. by ADLER 97B
$3.9^{+5.4+0.9}_{-1.8-0.7}$		<sup>5</sup> THOMSON	94	E621 Sup. by ZOU 96

<sup>1</sup> BATLEY 05 is obtained by measuring the interference parameters in  $K_S$ ,  $K_L \rightarrow \pi^+ \pi^- \pi^0$ :  $\text{Re}(\lambda) = 0.038 \pm 0.008 \pm 0.006$  and  $\text{Im}(\lambda) = -0.013 \pm 0.005 \pm 0.004$ ; the correlation coeff. between  $\text{Re}(\lambda)$  and  $\text{Im}(\lambda)$  is 0.66 (statistical only).

<sup>2</sup> ADLER 97B find the CP-conserving parameters  $\text{Re}(\lambda) = (28 \pm 7 \pm 3) \times 10^{-3}$ ,  $\text{Im}(\lambda) = (-10 \pm 8 \pm 2) \times 10^{-3}$ . They estimate  $B(K_S^0 \rightarrow \pi^+ \pi^- \pi^0)$  from  $\text{Re}(\lambda)$  and the  $K_L^0$  decay parameters. See also ANGELOPOULOS 98c.

<sup>3</sup> ZOU 96 is from the measured quantities  $|\rho_{+-0}| = 0.039^{+0.009}_{-0.006} \pm 0.005$  and  $\phi_\rho = (-9 \pm 18)^\circ$ .

<sup>4</sup> ADLER 96E is from the measured quantities  $\text{Re}(\lambda) = 0.036 \pm 0.010^{+0.002}_{-0.003}$  and  $\text{Im}(\lambda)$  consistent with zero. Note that the quantity  $\lambda$  is the same as  $\rho_{+-0}$  used in other footnotes.

<sup>5</sup> THOMSON 94 calculates this branching ratio from their measurements  $|\rho_{+-0}| = 0.035^{+0.019}_{-0.011} \pm 0.004$  and  $\phi_\rho = (-59 \pm 48)^\circ$  where  $|\rho_{+-0}| e^{i\phi_\rho} = A(K_S^0 \rightarrow \pi^+ \pi^- \pi^0, I=2)/A(K_L^0 \rightarrow \pi^+ \pi^- \pi^0)$ .

7.2 ±1.4      75      AKHMETSHIN 99 CMD2      Tagged  $K_S^0$  using  $\phi \rightarrow K_L^0 K_S^0$

<sup>1</sup> Reconstructed from  $K^0(\bar{K}^0)(t) \rightarrow \pi e \nu$  distributions using PDG values of  $B(K_L^0 \rightarrow \pi e \nu) = 0.4053 \pm 0.0015$ ,  $\tau_L = (5.114 \pm 0.021) \times 10^{-8}$  s and  $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$  s.

<sup>2</sup> Uses the PDG 00 value for  $B(K_S^0 \rightarrow \pi^+ \pi^-)$ .

<sup>3</sup> Obtained by imposing  $\sum_i B(K_S^0 \rightarrow i) = 1$ , where  $i$  runs over all the four branching ratios  $\pi^+ \pi^-$ ,  $\pi^0 \pi^0$ ,  $\pi e \nu$ , and  $\pi \mu \nu$ . Input value of  $B(K_S^0 \rightarrow \pi^+ \pi^-) / B(K_S^0 \rightarrow \pi^0 \pi^0)$  from AMBROSINO 06C is used. To derive  $\Gamma(K_S^0 \rightarrow \pi^+ \mu \nu) / \Gamma(K_S^0 \rightarrow \pi^+ e \nu)$ , lepton universality is assumed, radiative corrections from ANDRE 07 are used, and phase space integrals are taken from KTeV, ALEXOPOULOS 04A. This branching fraction enters our fit via their  $\Gamma(\pi^\pm e^\mp \nu_e) / \Gamma(\pi^+ \pi^-)$  branching ratio measurement.

## $K_S^0$ FORM FACTORS

For discussion, see note on  $K_{\ell 3}$  form factors in the  $K^\pm$  section of the Particle Listings above. Because the semileptonic branching fraction is smaller in  $K_S^0$  than  $K_L^0$  by the ratio of the mean lives, the  $K_S^0$  semileptonic form factor has so far been measured only in the  $K_{e3}$  mode using the linear expansion  $f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$ , which gives the vector form factor  $f_+(t)$  relative to its value at  $t = 0$ .

## ***CP* VIOLATION IN $K_S \rightarrow 3\pi$**

Written 1996 by T. Nakada (Paul Scherrer Institute) and L. Wolfenstein (Carnegie-Mellon University).

The possible final states for the decay  $K^0 \rightarrow \pi^+\pi^-\pi^0$  have isospin  $I = 0, 1, 2$ , and  $3$ . The  $I = 0$  and  $I = 2$  states have  $CP = +1$  and  $K_S$  can decay into them without violating  $CP$  symmetry, but they are expected to be strongly suppressed by centrifugal barrier effects. The  $I = 1$  and  $I = 3$  states, which have no centrifugal barrier, have  $CP = -1$  so that the  $K_S$  decay to these requires  $CP$  violation.

In order to see  $CP$  violation in  $K_S \rightarrow \pi^+\pi^-\pi^0$ , it is necessary to observe the interference between  $K_S$  and  $K_L$  decay, which determines the amplitude ratio

$$\eta_{+-0} = \frac{A(K_S \rightarrow \pi^+\pi^-\pi^0)}{A(K_L \rightarrow \pi^+\pi^-\pi^0)} . \quad (1)$$

If  $\eta_{+-0}$  is obtained from an integration over the whole Dalitz plot, there is no contribution from the  $I = 0$  and  $I = 2$  final states and a nonzero value of  $\eta_{+-0}$  is entirely due to  $CP$  violation.

Only  $I = 1$  and  $I = 3$  states, which are  $CP = -1$ , are allowed for  $K^0 \rightarrow \pi^0\pi^0\pi^0$  decays and the decay of  $K_S$  into  $3\pi^0$  is an unambiguous sign of  $CP$  violation. Similarly to  $\eta_{+-0}$ ,  $\eta_{000}$  is defined as

$$\eta_{000} = \frac{A(K_S \rightarrow \pi^0\pi^0\pi^0)}{A(K_L \rightarrow \pi^0\pi^0\pi^0)} . \quad (2)$$

If one assumes that  $CPT$  invariance holds and that there are no transitions to  $I = 3$  (or to nonsymmetric  $I = 1$  states), it can be shown that

$$\begin{aligned} \eta_{+-0} &= \eta_{000} \\ &= \epsilon + i \frac{\text{Im } a_1}{\text{Re } a_1} . \end{aligned} \quad (3)$$

With the Wu-Yang phase convention,  $a_1$  is the weak decay amplitude for  $K^0$  into  $I = 1$  final states;  $\epsilon$  is determined from  $CP$  violation in  $K_L \rightarrow 2\pi$  decays. The real parts of  $\eta_{+-0}$  and  $\eta_{000}$  are equal to  $\text{Re}(\epsilon)$ . Since currently-known upper limits on  $|\eta_{+-0}|$  and  $|\eta_{000}|$  are much larger than  $|\epsilon|$ , they can be interpreted as upper limits on  $\text{Im}(\eta_{+-0})$  and  $\text{Im}(\eta_{000})$  and so as limits on the  $CP$ -violating phase of the decay amplitude  $a_1$ .

## CP-VIOLATION PARAMETERS IN $K_S^0$ DECAY

$$A_S = [\Gamma(K_S^0 \rightarrow \pi^- e^+ \nu_e) - \Gamma(K_S^0 \rightarrow \pi^+ e^- \bar{\nu}_e)] / \text{SUM}$$

Such asymmetry violates  $CP$ . If  $CPT$  is assumed then  $A_S = 2 \text{ Re}(\epsilon)$ .
